## Acknowledgements

This publication was developed by the Information Sharing and Analysis Organization Standards Organization (ISAO SO) with representatives from the private, professional, and government communities in an ongoing effort to produce a unified voluntary set of guidelines and guidance for information sharing. The ISAO SO and the Working Group leadership are listed below.

### **ISAO Standards Organization**

Dr. Gregory B. White

*ISAO SO—Executive Director*

*Director, Center for Infrastructure Assurance and Security, UTSA*

Richard Lipsey,  
*ISAO SO—Deputy Director*  
*Senior Strategic Cyber Lead, LMI*

Brian Engle  
*Executive Director*  
*Retail Cyber Intelligence Sharing Center*

### **Working Group One—ISAO Creation**

Frank Grimmelmann  
*President & CEO*  
*Arizona Cyber Threat Response Alliance*

Deborah Kobza  
*President & CEO*  
*Global Institute for Cybersecurity & Research*

### **Working Group Two—ISAO Capabilities**

Denise Anderson  
*Executive Director*  
*National Health Information Sharing & Analysis Center*

Fred Hintermister  
*Manager*  
*Energy Subsector Information Sharing and Analysis Center*  
*North American Reliability Corporation*

### **Working Group Three—ISAO Information Sharing**

Kent Landfield  
*Director, Standards and Technology Policy*  
*Intel Corporation*

Michael Darling  
*Director, Cybersecurity and Privacy*  
*PwC*

### **Working Group Four—ISAO Privacy and Security**

Rick Howard  
*Chief Security Officer*  
*Palo Alto Networks*

David Turetsky  
*Partner*  
*Akin Gump Strauss Hauer & Feld LLP*

### **Working Group Five—ISAO Support**

Carlos Kizzee  
*Executive Director*  
*Defense Security Information Sharing Exchange*

Alex Crowther  
*Director of Research*  
*Center for Technology and National Security Policy*  
*National Defense University*

### **Working Group Six—ISAO Government Relations**

Michael Echols  
*Director, Cyber Joint Program Management Office*  
*Cybersecurity and Communications,*  
*Department of Homeland Security*

David Weinstein  
*Chief Technology Officer*  
*State of New Jersey*

The ISAO SO leadership would also like to acknowledge those individuals who contributed significantly in the development of these guidelines:

## 1 EXECUTIVE SUMMARY

These guidelines serve to address needs of newly forming Information Sharing and Analysis Organizations (ISAOs).

*(Note: An updated executive summary addressing the principles contained within these guidelines is planned for the final version. As this is a draft document that will continue to be edited and refined until its release in fall 2016, sections that appear in this version of the draft may not be included in the final release. Additional documents to be released will include more detailed discussions of various ISAO subjects.)*

## 2 INTRODUCTION

The importance of information sharing to computer security has been discussed for well over a decade. Early realization of its importance led to the creation of Information Sharing and Analysis Centers (ISACs) for critical U.S. infrastructure. In February 2015, the White House issued Executive Order (EO) 13691, “Promoting Private Sector Cybersecurity Information Sharing,” which called for the Secretary of the Department of Homeland Security (DHS) to “strongly encourage the development and formation of Information Sharing and Analysis Organizations (ISAOs).” These new entities could be “organized on the basis of sector, sub-sector, region, or any other affinity,” which greatly expanded the number and type of information sharing organizations that will be developed. To help with their establishment, EO 13691 directed DHS to “enter into an agreement with a nongovernmental organization to serve as the ISAO Standards Organization” (ISAO SO).

In developing the standards, guidelines, and other documents that are needed to help entities create and operate ISAOs, the ISAO SO established a number of Standards Working Groups (SWGs). These groups were created to address specific areas pertinent to creating or operating ISAOs. When developing the various documents, the SWGs consider the two overarching efforts important to ISAOs: the sharing of cybersecurity information, and the analysis of the information that has been shared. The purpose of these efforts is ultimately to improve the national ability to “detect, investigate, prevent, and respond to cyber threats,” while protecting the privacy and civil liberties of citizens.

To accommodate the expanded list of entities that can form ISAOs described in EO 13691, there will be different types of ISAOs with different objectives and capabilities. There will also be varying levels of organizations within the ISAOs, and there may be commercial entities that form to provide services to ISAOs. Some ISAOs may be formed on a very informal basis and may have little or no desire to collect and analyze the information in near-real time for its members. Other ISAOs may be highly interested in near-real time analysis and dissemination of actionable information to better protect its members and may have as an objective the ability to help respond to security incidents affecting its members.

45 Additionally, an ISAO may initially form with limited objectives and target capabili-  
46 ties but then evolve over time to increase its ability to assist its members by add-  
47 ing additional capabilities and objectives. For example, an ISAO may initially be  
48 created to simply share cybersecurity-related information among security profes-  
49 sionals in its member organizations; then increase the type and frequency of in-  
50 formation it shares, and add the capability to analyze shared information to better  
51 detect and prevent cybersecurity attacks; then ultimately add a 24/7 operational  
52 capability to assist its members with ongoing cybersecurity incidents. Conversely,  
53 an ISAO may elect to maintain limited capabilities to best serve the needs and  
54 capabilities of its constituents. The goal of the ISAO SO is to be as inclusive as  
55 possible in finding a place for any individual or organization that wishes to be part  
56 of the overall U.S. information sharing effort.

57 These guidelines are designed to take into consideration the different types of  
58 ISAOs that may be formed and the capabilities each may incorporate. It presents  
59 an organized approach to the various topics pertinent to ISAOs while considering  
60 the immediate needs of emerging ISAOs.

### 61 **3 THE ISAO ECOSYSTEM**

62 EO 13691 clearly lays out the challenges addressed by the creation of a network  
63 of ISAOs. It states:

64 In order to address cyber threats to public health and safety, national  
65 security, and economic security of the United States, private compa-  
66 nies, nonprofit organizations, executive departments and agencies,  
67 and other entities must be able to share information related to cyber-  
68 security risks and incidents and collaborate to respond in as close to  
69 real time as possible.

70 Organizations engaged in the sharing of information related to cyber-  
71 security risks and incidents play an invaluable role in the collective  
72 cybersecurity of the United States. The purpose of this effort is to  
73 encourage the voluntary formation of such organizations, to establish  
74 mechanisms to continually improve the capabilities and functions of  
75 these organizations, and to better allow these organizations to part-  
76 ner with the Federal Government on a voluntary basis.

77 Such information sharing must be conducted in a manner that pro-  
78 tects the privacy and civil liberties of individuals, that preserves busi-  
79 ness confidentiality, that safeguards the information being shared,  
80 and that protects the ability of the Government to detect, investigate,  
81 prevent, and respond to cyber threats to the public health and safety,  
82 national security, and economic security of the United States.

83 To address the challenges effectively will require more than just establishing a  
84 number of disparate information sharing organizations. It will require a coordi-  
85 nated effort that effectively identifies and considers the existence and ongoing

86 formation of ISAOs to understand where information sharing is occurring and its  
87 impact. Additionally, it will require considering how the efforts of individual ISAOs  
88 can be combined into an overarching information sharing network for the United  
89 States to improve the cybersecurity resiliency of participants. The effort must be  
90 as inclusive as possible, appropriately incorporating information from multiple  
91 sources. Due consideration must be given to determining the amount of trust that  
92 can be placed in such information, which requires that the national effort address  
93 issues such as trust, reliability, and information overload.

#### 94 **4 WHAT IS AN ISAO?**

95 According to 6 USC 131(5):

96 *The term “Information Sharing and Analysis Organization” means any formal*  
97 *or informal entity or collaboration created or employed by public or private*  
98 *sector organizations, for purposes of--*

99 *(A) gathering and analyzing critical infrastructure information, including infor-*  
100 *mation related to cybersecurity risks and incidents, in order to better under-*  
101 *stand security problems and interdependencies related to critical*  
102 *infrastructure, including cybersecurity risks and incidents, and protected sys-*  
103 *tems, so as to ensure the availability, integrity, and reliability thereof;*

104 *(B) communicating or disclosing critical infrastructure information, including*  
105 *cybersecurity risks and incidents, to help prevent, detect, mitigate, or recover*  
106 *from the effects of a interference, compromise, or a incapacitation problem re-*  
107 *lated to critical infrastructure, including cybersecurity risks and incidents, or*  
108 *protected systems; and*

109 *(C) voluntarily disseminating critical infrastructure information, including cy-*  
110 *bersecurity risks and incidents, to its members, State, local, and Federal Gov-*  
111 *ernments, or any other entities that may be of assistance in carrying out the*  
112 *purposes specified in subparagraphs (A) and (B).*

113 The primary characteristic of an ISAO in the cybersecurity ecosystem is that the  
114 ISAO shares cybersecurity information related to cybersecurity risks and inci-  
115 dents, between and among its membership. This holds true across a wide range  
116 of ISAOs with varying constituent membership organizations. While not all mem-  
117 bers of all ISAOs may be critical infrastructure entities, and some ISAOs will be  
118 organized around models other than sectors of critical infrastructure, ISAOs that  
119 share information related to cybersecurity risks and incidents meet the intent of  
120 EO 13691.

## 121 **5 ISAO CAPABILITIES AND CATEGORIES**

### 122 **5.1 INTRODUCTION TO CAPABILITIES**

123 Although no single description of capabilities will fit all ISAOs, it is important to  
124 consider a description of the functions of a “fully capable” ISAO for supporting its  
125 members. This discussion will help emerging ISAOs determine the capabilities  
126 and objectives they wish to develop—keeping in mind that the initial set of objec-  
127 tives and capabilities may evolve as the ISAO matures.

128 A fully capable ISAO will provide a variety of services to support its members.  
129 These services, and the capabilities that are needed to provide them, should be  
130 designed to support ISAO members as they manage strategic and tactical cyber-  
131 related risks. The type of support can be grouped into three broad categories,  
132 with some overlap between them. These categories are:

- 133 • **Situational awareness:** ISAO members need to understand both the tactical  
134 and strategic aspects of the environment in which they are managing risks.  
135 This support includes activities to collect and share information, analyze it,  
136 and recommend what to do with it.
- 137 • **Decision-making:** ISAOs need to disseminate actionable information that will  
138 enable their members to make decisions related to their current security pos-  
139 ture and allocation of security and IT resources. This support involves receiv-  
140 ing information, establishing its relevance to the organization, assessing  
141 potential impacts, identifying potential actions, and selecting the best course  
142 of action.
- 143 • **Actions:** ISAO members ultimately will take actions based on received infor-  
144 mation and analysis. Organizations will develop detailed actions and assign  
145 responsibilities, implement the actions, and evaluate their effectiveness,  
146 providing feedback for further consideration.

147 For each type of support, individual members or organizations will have responsi-  
148 bilities addressing their own needs as well as responsibilities to the ISAO. The  
149 ISAO in turn also has responsibilities for each of these categories that address  
150 the ISAO membership as a whole.

### 151 **5.2 VALUE PROPOSITION**

152 Fundamental to the establishment of an ISAO will be the “value proposition” to be  
153 offered its participants, members, and collaborators. An ISAO must provide a  
154 tangible benefit in order for it to enroll members. ISAOs offer the following bene-  
155 fits to their members and other ISAOs:

- 156 • An informative set of cybersecurity threat indicators and best practices pro-  
157 vided by ISAOs will make individual members more secure.

- 158
- 159
- 160
- ISAOs implemented in accordance with a consistent yet flexible framework can replicate and extend current trust relationships by establishing a common, shared set of values and expectations.
- 161
- 162
- Members enhance their knowledge about how to protect themselves from, detect, and react to cyber-attacks.
- 163
- 164
- 165
- 166
- 167
- By aggregating information from multiple organizations, ISAOs present a richer picture of malicious activity taking place around the country and the world. Member organizations can use this enriched information to improve their individual and collective security, blocking attacks they would not have seen otherwise.
- 168
- 169
- ISAO members can carry out effective and timely responses if they discover unauthorized intrusions.

### 170 **5.3 INFORMATION SHARING CONCEPTS**

171 Besides the value proposition, also fundamental to the establishment of an ISAO  
172 will be the categories of information to be collected, disseminated, and shared.  
173 The following guidance is provided to assist ISAOs in developing their infor-  
174 mation sharing policy considerations.

175 Before ISAOs can begin sharing with members or customers, it is important that  
176 they understand the needs of their members or customers. ISAOs are not formed  
177 in a vacuum. In many cases, the ISAO itself is formed by a community of like-  
178 minded organizations who have made the decision to collaborate with peers as a  
179 means to manage risk. In this case, the ISAO should be designed from the be-  
180 ginning by the members to meet the needs of the members.<sup>1</sup> In other instances,  
181 an ISAO is a for profit company providing services to paying customers. In such  
182 cases it is important for the ISAO company to understand and quantify its unique  
183 value proposition for its customers.

184 There are a variety of questions that an emerging ISAO will want to answer in or-  
185 der to determine its information sharing policy. The previous categories of infor-  
186 mation should be considered along with questions such as the following.<sup>2</sup>

- 187
- 188
- Which categories of information do the ISAO members want to share with each other?
- 189
- 190
- What information do ISAO members need to help enhance their situational awareness?
- 191
- Will the ISAO members provide to the ISAO raw data, analysis, or both?
- 192
- Will the ISAO provide its members raw data, analysis, or both?

---

<sup>1</sup> See ISAO Formation Section for more detail.

<sup>2</sup> Consult ISAO 100-2 for additional guidance.

- 193 • What information do ISAO members need to assist them in tactical decision-  
194 making?
- 195 • Do members expect to receive from the ISAO information related to defensive  
196 measures, mitigation activities, best practices, and/or incident coordination?
- 197 • Do members expect the ISAO to provide analysis such as trending analysis  
198 and insight on threat actor targeting and motivation

199 When organizations come together to create an ISAO, they do so with an under-  
200 standing of what their information needs are. They are organizing for a specific  
201 purpose. It is appropriate that the ISAO's information sharing policies be in-  
202 formed by and designed to meet those purposes. For example, if a community  
203 forming an ISAO wants more information on effective practices to mitigate spe-  
204 cific attacks, the ISAO would want to build policies that facilitate this purpose.  
205 Similarly, in a for-profit ISAO, it is important that the company providing ISAO  
206 services understand the specific market niche it is targeting and how the ISAO  
207 product and services add value to its customers. In either case, when developing  
208 information sharing policies, ISAOs may want to align their policies with the  
209 member objectives and customer needs.

210 For example, if an ISAO and its members choose to share information that will  
211 enhance member situational awareness, the burden is on the members or cus-  
212 tomers to clearly identify what information they need to enhance their situational  
213 awareness. If members are looking for contextual information, but the ISAO pro-  
214 vides raw indicators instead, it will be difficult to meet the member or customer  
215 needs. Likewise, if members are looking for effective mitigation practices but the  
216 ISAO provides detailed malware analysis, members will not receive the desired  
217 information.

218 There are various types of information an ISAO and its members may want to  
219 share. The following is not an exhaustive list of types of information ISAOs may  
220 choose to share, and there is no expectation that an ISAO share all or any of the  
221 following information. An ISAO and its members or customers can choose to  
222 share or not share information based on what meets the mission of the ISAO and  
223 the needs of its members. Not all information is appropriate for all ISAOs or all  
224 members and customers.

225 Potential information that an ISAO and its members could choose to share in-  
226 cludes:

- 227 • Malicious Internet Protocol (IP) addresses
- 228 • Malware analysis
- 229 • Automated sharing of raw threat indicators
- 230 • Effective cybersecurity practices for a specific community or incident
- 231 • Generic effective cybersecurity practices

- 232 • Big data analytics
- 233 • Attack trending and analysis
- 234 • Assessments on specific threat actors or campaigns
- 235 • Attacks specific companies have seen on their networks
- 236 • Aggregated attack information from multiple customers/members
- 237 • Information shared by for-profit ISAOs through managed security services
- 238 • Single-vendor vulnerability information
- 239 • Cross-platform or multi-vendor vulnerability information
- 240 • Vulnerability remediation tactics
- 241 • Information on a specific, ongoing or current cyber threat or attack
- 242 • Threat intelligence reports developed by other parties
- 243 • Open-source news reporting
- 244 • Presentations and discussions from subject matter experts
- 245 • Government alerts
- 246 • Vendor alerts
- 247 • Indicators of compromise.

248 In developing information sharing policies for ISAOs, it is important for members  
249 and customers to agree on the proper role of the ISAO itself. For example, de-  
250 pending on the needs and requirements of its members and customers, an ISAO  
251 could choose to do one or more of the following:

- 252 • Provide a platform for and facilitate member sharing.
- 253 • Deploy sensors to gather and share unique information beyond member infor-  
254 mation.
- 255 • Subscribe to a third-party service that provides threat intelligence feeds.
- 256 • Collect, aggregate, and disseminate open-source reporting.
- 257 • Collect, aggregate, and disseminate reporting from partner organizations.

258 Understanding the purpose of the individual ISAO, what it shares and how it  
259 functions will help potential and current members better understand and evaluate  
260 how the ISAO can add value to that individual organization. For example, if an  
261 ISAO is designed by its members to be a facilitator of sharing among members, it  
262 is not fair to expect that the ISAO will provide managed services or incident re-  
263 sponse capabilities. However, just because an ISAO may not provide value to  
264 one organization does not mean that it cannot or does not provide value to oth-  
265 ers.

266 Once it is understood as to the type of information that will be shared through the  
267 ISAO, it is important that members, customers, and the ISAO staff (if any) under-  
268 stand triggers for sharing information within the ISAO. It is not enough to say  
269 “share.” It is important to know what to share and when to share it.

270 Sharing among members and the ISAO may be done automatically from ma-  
271 chine to machine. Sharing indicators in an automated fashion can enable infor-  
272 mation to be shared more rapidly and can also increase the volume of indicators  
273 that are shared. This technology is emerging and not fully deployed. But even in  
274 these cases, it is important that the machines understand what they should be  
275 sharing with their ISAO and ISAO members.

276 When humans are involved, the process can be slower, but the value of the data  
277 shared can be enhanced if the organization sharing the information provides in-  
278 formation on how it identified and mitigated the attack or other context. Human-  
279 to-human sharing also can increase trust among participants, making them more  
280 willing to share. As such, there is value in both automated exchange and human  
281 exchange. ISAOs can choose to share information via automation, human inter-  
282 action, or a combination of the two.

283 The ISAO members determine what information is shared, when it is shared, and  
284 how it is shared. They will make these decisions based on the mission of the  
285 ISAO and the capabilities of its members and customers. To help guide this deci-  
286 sion making process of what to share, the ISAOs and their members and part-  
287 ners may want to consider the following potential (non-inclusive) examples:

- 288 • Share information only on attacks that disrupted a member’s business opera-  
289 tions.
- 290 • Share information only on attacks that made it past members’ intrusion detec-  
291 tion/prevention systems.
- 292 • Share vulnerability information on members’ products or services.
- 293 • Share vulnerabilities discovered in products or services provided by non-  
294 members.
- 295 • Share information on vulnerabilities that were successfully exploited in an at-  
296 tack on a member network.
- 297 • Share open-source news, including third-party threat reports.
- 298 • Share information on multiple attacks originating from the same source.
- 299 • Share all malicious indicators discovered throughout member enterprises.
- 300 • Share remediation advice on how to identify or mitigate a specific attack.

301 Once members and customers agree to and understand what information they  
302 wish to receive through an ISAO, they can begin to develop policies on what the  
303 ISAO can do with the information and how that information can be shared.

304 Some ISAOs may choose to enable sharing without attribution, while other  
305 ISAOs may choose to require attributing shared information with a specific mem-  
306 ber. Non-attribution could make a member feel more comfortable in sharing, but  
307 knowing who is sharing the information could provide greater confidence in its  
308 quality and accuracy. ISAOs are free to establish the policies that they determine  
309 best meet the needs of their organization, membership, and customers.

310 An ISAO and its members also may want to develop information sharing policies  
311 that consider the sensitivity of the information being shared. For example, the  
312 more sensitive the information, the more security an ISAO may choose to deploy.  
313 There are specific security and privacy practices, but it is important to emphasize  
314 that the ISAOs and their members may choose how to share information, based  
315 on its sensitivity and member capabilities.

316 Having information sharing policies also helps members understand how they  
317 can use the information that is shared within the ISAO and with other partners.  
318 ISAOs may want to consider establishing policies that detail how members can  
319 use and share information. This could include the following:

- 320 • How members can *share* the information they receive from the ISAO
- 321 • How members can *use* the information they receive from the ISAO—for ex-  
322 ample, can they use the indicators to protect their customers or just their en-  
323 terprise?
- 324 • Whether the ISAO can share the information with other partners
- 325 • How shared information should be marked
- 326 • How to treat information that is shared over the phone or during virtual and in  
327 person meetings.

328 There are various ways to incorporate such policies. Some of these include:

- 329 • Asking members to sign a separate non-disclosure agreement
- 330 • Having a non-disclosure agreement included as part of the member agree-  
331 ment
- 332 • Describing the appropriate use of information in service level agreements or  
333 customer contracts
- 334 • Detailing how the information can be used in a concept of operations  
335 (CONOPS)
- 336 • Developing a separate, stand-alone, information use agreement within the  
337 ISAO.

## 338 **5.4 CREATING AN ISAO**

### 339 **5.4.1 KEY STRATEGIC PLANNING FACTORS**

#### 340 **DEFINING THE VALUE PROPOSITION**

341 An ISAO's value proposition is a promise of value to be delivered. Creating an  
342 ISAO requires working with community stakeholders to define the ISAO's value  
343 proposition to improve cybersecurity for its constituents and membership part-  
344 ners – supported by the ISAO's goals and objectives.

- 345 • Who is the ISAO's target community? Critical Infrastructure, Industry, Busi-  
346 ness, Government? Local, Regional, Statewide, National, International? If in-  
347 ternational, consider whether sharing information with international partners  
348 will present challenges from a legal and/or "safe-sharing culture" point of  
349 view.
- 350 • Will the ISAO be limited to one critical infrastructure sector or sub-sector, mul-  
351 tiple sectors, or support an industry or business community?
- 352 • What is ISAO's vision? How do the ISAO stakeholders and members picture  
353 the ISAO one year after formation, after five years, etc.? For each timeline  
354 milestone, where will the ISAO be in terms of size, geographic scope, prod-  
355 ucts, services and activities?
- 356 • What goals does the ISAO intend to achieve? Goals may range from raising  
357 awareness locally through information sharing of basic threat intelligence in-  
358 formation among individuals, to high-speed real-time sharing of technical  
359 threat intelligence on an automated, global basis across an entire sector.  
360 Goals may also evolve over time as the ISAO grows in size and resources.
- 361 • How will the ISAO improve the cybersecurity position of the sharing partners  
362 and members of the ISAO? What information sharing problem will the ISAO  
363 solve?
- 364 • What types of cybersecurity information will the ISAO be sharing (i.e. warning  
365 fellow members of the types of emerging cyber threats in a particular sector,  
366 industry or business; and/or sharing of technical details of cyber threat intelli-  
367 gence from basic Internet protocol address information to technical indicators  
368 of malicious software code that members can use to detect problems on their  
369 systems).
- 370 • How does the ISAO intend to share information, at least initially? For exam-  
371 ple, informally and on a person-to-person basis, manually through online por-  
372 tals, or via automated information sharing platforms. The ISAO may start with  
373 informal sharing and mature into exploring what technologies exist to allow for  
374 rapid sharing of threat indicators.
- 375 • How will the ISAO maintain sustainability? What funding models support the  
376 ISAO – Grant(s), Corporate Sponsorship, Membership Model, etc.

- 377 • How will the ISAO identify, engage and encourage member and stakeholder  
378 participation and collaboration?
- 379 • Has the ISAO identified target community leaders to champion the ISAO  
380 throughout the community, encouraging participation? Is the targeted com-  
381 munity already sharing information?
- 382 • What does the ISAO have to offer the community of sharing partners to en-  
383 enhance the protection of critical infrastructure, industry, business or govern-  
384 ment?
- 385 • What are other similar ISAOs currently providing and how can you coordinate,  
386 collaborate and work together?
- 387 • What is the ISAO planning to do differently than other ISAOs? What solution  
388 can you bring to information sharing that is unique to the ISAO?
- 389 • Is internal and external collaboration part of the ISAO's natural workflow?
- 390 • Has the ISAO defined strategic information sharing partners? Have the mutu-  
391 ally beneficial objectives of partner strategic alliances been defined?
- 392 • What will the ISAO's value-added actionable content be: threat information  
393 (threat observables, indicators, incidents, adversary tactics/techniques/proce-  
394 dures, exploit targets, courses of action, campaigns, threat actors), incident  
395 analysis, analytics, vulnerabilities?
- 396 • How will the ISAO ensure that information shared is actionable?
- 397 • Does the ISAO plan to acquire analytic capability to apply to information that  
398 is shared for members, and share analytics with others external to the ISAO?
- 399 • How will the ISAO work with other partners to enhance the value of the infor-  
400 mation received? Will the ISAO openly share with other ISAOs?
- 401 • Does the ISAO have special expertise in cybersecurity and information shar-  
402 ing?
- 403 • How will the ISAO share information with its members?
- 404 • What core set of services with the ISAO offer that adds value to the ISAO's  
405 members? For example, will it act as a hub to share cyber threats and defen-  
406 sive measures, will it analyze data and turn it into "actionable" intelligence, or  
407 both?
- 408 • Beyond the core set of information sharing services, what additional services  
409 does the ISAO desire to provide to enhance the core ISAO services, thereby  
410 adding further value to members?
- 411 • What is the plan for future ISAO service offerings?

**412 5.4.2 BUILDING A TRUSTED COMMUNITY**

413 Trust is an essential component of the ISAO’s information sharing relationship  
414 with internal (staff/members) and external partners.

415 • Will trust be based informally on existing relationships, or more formally established  
416 via membership or information sharing agreements, confidentiality agreements, infor-  
417 mation sharing policies and protocols, or a combination of these? A formal agree-  
418 ment and/or written policies may facilitate a “safe sharing” culture among members.

419 • Will new members be subject to vetting and due diligence by existing members be-  
420 fore they are granted access to information?

421 • How will members be accountable to one another and ensure the information being  
422 shared is not used inappropriately? Who will monitor compliance with the member-  
423 ship or information sharing agreements, confidentiality agreements and/or infor-  
424 mation sharing policies and protocols?

425 ISAOs must establish a basis of trust among sharing partners and members (inter-  
426 nally and externally). To establish and sustain the ISAO’s culture of trust, ISAOs  
427 should consider defining:

428 • **Trust Model Planning**—A plan with measurable goals to create a trust model  
429 for the ISAO.

430 ■ ISAO member—new member trust expectations

431 ■ How will transparency be ensured among sharing partners?

432

- 433 • **The Sharing Model**—People-to-people, organization-to-organization, organi-  
434 zation-to-government, restricted, or open membership sharing
- 435 • **Sharing Model Scope**—Local, regional, state, national, international
- 436 • **Sharing Model Platform**—Automated or manual
- 437 • **Partner and Member Vetting**—Requirements and process. National? Inter-  
438 national?
- 439 • **Information Sharing**—Based on informal or existing relationships, or more  
440 formally established—membership/information sharing agreements, confiden-  
441 tiality/non-disclosure agreements, information sharing policies and protocols,  
442 or a combination?
- 443 • **ISAO Information Sharing Agreement**
  - 444 ■ Information sharing rules (protocols), rules of behavior, secure access to  
445 information
  - 446 ■ Risks and consequences when information sharing rules are broken

### 447 **5.4.3 ISAO MEMBERSHIP**

448 ISAO membership includes establishing a membership model consisting of the  
449 following:

- 450 • **Membership requirements**—Criteria for membership consideration
  - 451 ■ Membership requirements—Minimum set of requirements been defined  
452 for membership?
  - 453 ■ Members—Individuals, organizations, or both
  - 454 ■ Members—Limits on membership
  - 455 ■ Membership requirements adherence policy—Monitoring process
- 456 • **Membership model**—Cost to join the ISAO
  - 457 ■ Membership value/return on investment (ROI)—ISAO provided products  
458 and services
  - 459 ■ Membership cost
- 460 • **Member nomination and recruiting**
  - 461 ■ Member identification, nomination and recruiting strategy
  - 462 ■ New member outreach plan—Tactics used to reach potential new mem-  
463 bers

464

- 465
- **Membership vetting policies and processes**
  - 466
    - Membership vetting policy—Including assessment and probation in the
    - 467 event of member issues
  - 468
    - Membership acceptance voting rules
  - 469
    - Membership vetting process—Including assessment, approval (by man-
    - 470 agement or member voting)
  - 471
  - **New member tactical onboarding considerations**
  - 472
    - Membership/information sharing agreement process—Signing, recording,
    - 473 storage of membership/information sharing agreements
  - 474
    - New membership onboarding—Training. Who receives training and how
    - 475 will it be delivered?
  - 476
    - New member introductions process—To all members and ISAO manage-
    - 477 ment/staff/board of directors
  - 478
  - **Membership retention**
  - 479
    - ISAO-to-member communication to ensure that the ISAO meets members'
    - 480 expectations

#### 481 **5.4.4 ISAO MARKETING AND COMMUNICATIONS**

482 Whether an ISAO is established for the public or private sector, the ISAO should  
483 define and have resources to implement a marketing and communications strat-  
484 egy.

#### 485 **MARKETING PLAN—DEFINE, DEVELOP, MAINTAIN AND MEASURE**

- 486
  - Essential marketing policies and processes—Who will define, develop and
  - 487 maintain the plan?
- 488
  - Leveraging the ISAO's value proposition:
  - 489
    - ISAO's foundational value proposition positioning statement—This in-
    - 490 cludes how the positioning statement will be used in recruiting members,
    - 491 internal member communications, and external communications
  - 492
    - Goals and objectives
  - 493
    - Envisioned capabilities
  - 494
    - Value and benefits the ISAO is Intending to deliver
  - 495
    - Differentiation from other ISAOs
  - 496

- 497 • Tactical marketing tools—Reaching the ISAO’s audience
- 498     ■ Marketing communications policy—Rules, responsibilities, authorities, ac-  
499     tivities, budget
- 500     ■ What tactical marketing tools will the ISAO use to communicate externally  
501     (events, online, documentary materials, public relations, advertising, pri-  
502     vate recruitment, etc.)?
- 503     ■ Sponsor advertising policies—Does the ISAO accept sponsor-recognized  
504     advertising?

## 505 **COMMUNICATIONS PLAN (STRATEGY)**

- 506 • **External communications** (exclusive of threat intelligence information shar-  
507 ing)
  - 508     ■ Communications policy—Rules, responsibilities, authorities, and activities  
509     for external communications
  - 510     ■ External communications governance methods and approaches—What  
511     methods and approaches will be used to communicate governance mat-  
512     ters bi-directionally with other ISAOs, the ISAO governing body, strategic  
513     alliances and with government organizations?
  - 514     ■ Communication tactical tools—What tactical tools will the ISAO use to  
515     communicate externally (listserv, portal, newsletters, email, news feeds,  
516     calendars, etc.)?
- 517 • **ISAO member communications** (exclusive of threat intelligence information  
518 sharing)
  - 519     ■ Member communication policy—Roles, responsibilities, authorities and ac-  
520     tivities for member communications
  - 521     ■ Member communications governance methods and approaches—What  
522     will be the methods and approaches used to communicate bi-directionally  
523     with ISAO members about matters such as membership recruitment and  
524     onboarding, ongoing policy and capabilities development, strategic plan-  
525     ning, accomplishments, etc.?
  - 526     ■ Allowed ISAO communications policy—What is the defined set of allowed  
527     communications between ISAO members? Is it based on industry or gov-  
528     ernment regulation? If so, what are those allowed communications?
  - 529     ■ ISAO member communication roles—What are the ISAO member roles  
530     that send/receive information, and what type of information should each  
531     role send/receive?
  - 532     ■ Communication tactical tools—What tactical tools will the ISAO use to  
533     communicate bi-directionally with members (listserv, portals, newsletters,  
534     email, news feeds, calendars, etc.)?

## 535 **5.4.5 ISAO OPERATIONS AND FINANCIAL MANAGEMENT**

536 To sustain an ISAO, defining an operations and financial management plan is  
537 paramount to ensure the ISAO’s sustainability. The following factors should be  
538 considered: cost drivers, funding models, and membership models:

### 539 **OPERATIONS AND FINANCIAL MANAGEMENT**

- 540 • **Cost drivers**—If an assessment of the external environment is performed,  
541 the findings from that assessment are foundational requirements and key in-  
542 puts into the ISAO’s Operations and Financial Plan.
- 543 • **ISAO costs**—Depending upon the services, skills, and technologies needed  
544 by the ISAO to deliver its services, certain costs may prove to be a significant  
545 portion of the ISAO’s operational expenditure. The following key cost drivers,  
546 expenses and capital requirements are needed to be taken into consideration  
547 for creating and sustaining an ISAO, and for day-to-day operation.
  - 548 ■ ISAO management and operations
    - 549 ○ Organization formal formation—Legal services, state/federal regulatory  
550 requirements, tax/accounting services
    - 551 ○ Support staff—Regardless of the size and number of members belong-  
552 ing to the ISAO, careful consideration should be noted as to the sup-  
553 port staff required for ISAO management and operations day-to-day:  
554 executive management, managers, analysts, product development,  
555 member identify management, risk & compliance, membership devel-  
556 opment, etc.
    - 557 ○ Professional services (consulting support, etc.)
  - 558 ■ Infrastructure and technology—Technology plays a key role in the ISAO,  
559 and technology solutions vary widely in terms of cost. The ISAO should  
560 determine the operational and infrastructure requirements to support and  
561 sustain the ISAO including, but not limited to:
    - 562 ○ Software—Applications and licensing fees for core ISAO services (in-  
563 formation capture/distribution/analysis/alerting (build vs. buy decision),  
564 tools for handling sensitive data (i.e., anonymization), applications for  
565 supporting ISAO daily operations (finance, security, IT service man-  
566 agement, membership development, collaboration tools, etc.)
    - 567 ○ Analytics—Analytics processing capabilities required and to what de-  
568 gree to support analysis and enrichment of data (in-house, out-  
569 sourced, or hybrid model)
    - 570 ○ Hardware—Onsite vs. cloud computing, system security, large storage  
571 capacity requirements, disaster recovery, etc.
    - 572 ○ Data feed providers—External vendors providing feeds and products  
573 the ISAO can provide to their membership and to help support enhanc-  
574 ing data analysis

- 575  
576  
577
- Promotion costs—Developing in-house marketing and outreach capabilities to generate interest in the ISAO’s target market community, grow membership, and manage member relationships
- 578  
579  
580  
581  
582
- Member needs—Number of member organizations; ISAO membership target community, including the number, size, and needs of the members that will impact costs (anticipated number of threat feeds as well as onboarding and integrating members into the ISAO information sharing infrastructure community)
- 583  
584  
585  
586  
587
- Training and education—Continuous training of management and support staff (security—all hazards, both physical and cyber), ISAO policies and procedures, ISAO infrastructure information exchange/sharing platforms, information sharing policies and protocols, and any additional services offered by the ISAO.

## 588 **FUNDING MODELS**

589 ISAO revenue streams will be dependent upon the type of business model the  
590 ISAO chooses, including membership fees. Based on the type of ISAO business  
591 model, funding options and potential sources of revenue need to be considered.

- 592
- Funding model tax implications (from ISAO and member perspective)
  - Public support funding model (i.e. government grants for non-profit organizations)
  - Financial reporting (board of directors, members, government).

596 **Error! Not a valid bookmark self-reference.**Figure 1 identifies various types of  
597 funding models.

## 598 **MEMBERSHIP MODELS**

599 There are many different categories of membership an ISAO can offer (basic,  
600 standard, premium). Membership categories fall in line with the service offering  
601 provided as part of the strategy and membership value the ISAO is offering. The  
602 following considerations should be taken:

- 603
- What will be the different benefits associated with each membership category (i.e., analytics, data feeds, access to seminars, conferences)?
  - What is the ISAO Membership Fee Structure associated with each membership category?
  - Are membership fees tiered, dependent upon a member organization’s size and/or business structure (i.e. for profit, nonprofit, etc.)
  - Will each member have access to all services regardless of membership category?
- 607  
608  
609  
610  
611

612

Figure 1: ISAO Operations &amp; Financial Management Funding Models

## ISAO Operations & Financial Management: Funding Models

The following ISAO Business Model outlines potential sources of revenue for an ISAO depending upon the ISAO business model.

Sources of Revenue	ISAO BUSINESS MODEL		
	Member-Driven Not-for-Profit	Profit Driven: Charge for membership, include many value-add services	Profit Driven: No charge for basic services, aim to capture as many clients as possible, and look to gain revenue in other ways (i.e., cyber data feeds, advertising, etc. )
<b>ISAO Membership:</b> Members pay an annual fee to gain access to the basic services of the ISAO. The ISAO may utilize a tiered pricing model based on the types of services to be delivered. <sup>1</sup>	•	•	Free
<b>Access to Data Feed (Basic)</b>	•	•	Free
<b>Advertising/Recognition Model</b>	•	•	•
<b>Selling of Data to Non-Member Firms</b>	•	•	•

<sup>1</sup> Membership models can be a strong source of revenue depending on the strategic vision of an ISAO. Tiered pricing models (i.e., Basic, Standard, Premium) can be adapted that carries different add-on services for each member tier.

613

## ISAO Operations & Financial Management: Funding Models (cont'd)

Sources of Revenue	ISAO BUSINESS MODEL		
	Member-Driven Not-for-Profit	Profit Driven: Charge for membership, include many value-add services	Profit Driven: No charge for basic services, aim to capture as many clients as possible, and look to gain revenue in other ways (i.e., cyber data feeds, advertising, etc. )
<b>Build products that use information gathered from ISAO</b>	No	•	•
<b>Sponsorship</b>	•	•	•
<b>Sell Related Service (e.g. breach response consulting)</b>	•	•	•
<b>Enhanced Premium Services:</b> If members want additional services, they are required to pay additional premium for these services	Not for profit firms may adopt premium model as way of funding basic services.	Decision on whether to include these in cost of membership based on need to attract a number of members and competition.	Need to attract and service (at low cost) large number of clients will drive level of enhanced services offered for free.

614

## 615 5.4.6 ISAO GOVERNANCE

### 616 A PRACTICAL APPROACH TO FORMING AN ISAO

617 An ISAO may elect to form in an informal or formal capacity. Although there are  
618 many legal and other considerations that may seem complicated, it is important  
619 to keep in mind that governance choices can flow easily from the founder's vision  
620 and goals for the ISAO.

621 It is important to recognize that the vision, goals, and membership of the ISAO  
622 may change considerably over time, which may support consideration of starting  
623 an ISAO with a smaller, less formal organization and making changes to the gov-  
624 ernance structure as the ISAO evolves and matures over time.

### 625 FORMAL VS. INFORMAL GOVERNANCE STRUCTURES

626 The following questions should be considered to support the decision of estab-  
627 lishing the ISAO in an informal or formal governance structure:

- 628 • **Membership requirements**—Will the ISAO require members to agree for-  
629 mally to written requirements of membership? If so, one way to accomplish  
630 this is a formal legal entity to which members can agree through a member-  
631 ship agreement, memorandum of understanding, information sharing agree-  
632 ment, or similar document.
- 633 • **Membership fees/payments**—If the ISAO will receive and make payments,  
634 how will those be treated from a tax-standpoint and according to applicable  
635 law and regulatory requirements? A formal legal entity, including not-for-profit  
636 status if applicable under local and federal law, may be the best approach.
- 637 • **Third parties**—Do you expect the ISAO to engage in activities that require  
638 contracting with a third party? If not, a separate legal governance structure  
639 may not be necessary, at least until the ISAO begins to encounter such  
640 needs. The following are points to consider with respect to whether it is nec-  
641 essary or prudent for the ISAO to contract with third parties:
  - 642 ▪ **Office space**—If the ISAO will be meeting in person periodically, will the  
643 ISAO need to lease space to do so, or will a particular member provide  
644 space where the ISAO management and members can meet? If the ISAO  
645 needs to rent space for meetings and operations, will an individual mem-  
646 ber step forward and sign the lease, or will the ISAO need a formal legal  
647 entity of its own to do so? Alternatively, short-term conference or meeting  
648 space rentals may be available without the need to establish the ISAO as  
649 a formal legal entity, provided the members establish a framework to  
650 share costs.
  - 651 ▪ **Physical resources**—What physical resources will the ISAO need that may  
652 require third-party contracts? For example, will it need server space to  
653 host a cybersecurity threat intelligence information sharing platform? Will  
654 that server and the space where it resides require a third party contract? If  
655 so, establishing the ISAO as a formal legal entity may be necessary.

- 656
- 657
- 658
- 659
- 660
- 661
- 662
- 663
- **Professional services**—Will the ISAO engage in activities that may require the advice of outside experts, such as technical experts to assist in setting up sharing mechanisms or legal services to advise on particular activities according to local, state, or federal laws and regulations? Will the ISAO employ any full-time or part-time employees, or will it rely on consultants and contractors to facilitate the sharing and analysis of information? In either case, establishing the ISAO as a formal legal entity may be necessary.
  - **Financial management**—Will the ISAO require its own bank account to pay for services or to receive funds? For example, if the ISAO will require members to contribute to a budget (whether by dues or otherwise) to cover the ISAO’s organizational and operational costs or to hire full- or part-time staff, establishing the ISAO as a formal legal entity or establishing a separate legal entity to receive and make payments may be necessary. Similarly, if the ISAO will be funded by federal grants or private donations, its benefactors may require a separate legal entity (and, possibly, not-for-profit status) in order for the ISAO to receive funds.
  - **Insurance**—Will members require the ISAO to obtain insurance to cover its activities? If so, establishing the ISAO as a formal legal entity may be required to enter into insurance contracts.
- 664
- 665
- 666
- 667
- 668
- 669
- 670
- 671
- 672
- 673
- 674
- 675

## 676 **TYPES OF FORMAL LEGAL ENTITIES**

677 If the ISAO has concluded based on the preceding questions that establishing  
678 the ISAO as a formal legal entity is necessary to serve the ISAO’s members’  
679 needs, the ISAO and its stakeholders should consider the following information to  
680 decide on the type of formal legal structure. Ultimately, however, the ISAO may  
681 want to consult legal counsel to assist in choosing the most appropriate type of  
682 legal structure to meet the ISAO’s needs.

- 683
- 684
- 685
- 686
- 687
- **For-profit or non-profit activities**—Is it the expectation of the ISAO to engage in for-profit activities or operate purely on a non-profit basis? If the latter, the ISAO may consider in consultation with legal counsel whether a non-profit status is the most advantageous form of corporate entity from a tax standpoint.
  - **Formal legal structure**—What type of legal entity will best address the needs of the ISAO to conduct business while insulating the members from liability? Within the United States, a range of recognized legal entities are possible depending on applicable state law. These include corporations, limited liability companies, various forms of partnerships, and several others. Each has particular advantages and disadvantages that you should discuss with legal counsel according to applicable local and state law.
- 688
- 689
- 690
- 691
- 692
- 693
- 694

695

- 696  
697
- **Legal fiduciary duties, board of directors**—Local laws may impose fiduciary duties on directors of the legal corporate entity.
    - **For-profit legal fiduciary duties**—Directors of for-profit corporations in the United States typically owe to shareholders the primary duties of “care” and “loyalty,” requiring directors to act in the same manner as a reasonably prudent person in their position, and to act in good faith in the best interests of the corporation and its shareholders.
    - **Limited liability company (LLC)**—Members of a limited liability company may contractually agree to waive the fiduciary duties of directors and officers in the operating agreement governing the LLC.
    - **Public benefit corporations**—In the United States, many states also recognize “public benefit corporations,” which may consider social or other concerns over profits. Public benefit corporations may be required to provide regular reporting of the organization’s efforts to meet its public good goal, known as “public benefit assessment.”
    - **Non-profit legal fiduciary duties**—Directors and officers of non-profit organizations are considered fiduciaries, or persons of trust, with the power and obligation to act with total trust, good faith, and honesty on behalf of the organization. Fiduciary duties include the duty of care, the duty of loyalty, and the duty of obedience.
      - Duty of care—Obligations to keep informed, remain attentive, and act in a manner that is in the best interest of the organization.
      - Duty of loyalty—Obligations to act in good faith and in a manner that the individual reasonably believes to be in the best interests of the organization (motives, purposes, and goals).
      - Duty of obedience—Obligations to adhere to carrying out the purpose and mission of the organization, as expressed in the organization’s governing legal documents (bylaws, etc.).
  - **Liability protection**—If liability protection is the primary consideration, a corporate form or a limited liability corporation may be most appropriate. In the United States, the concepts of “limited liability” and “separate legal personality” are actively enforced; however, it may be possible to “pierce the corporate veil” and impose an entity’s “separateness” (such as by commingling assets). The ISAO should consult with legal counsel regarding liability protection, which is typically governed by state law.
- Foreign jurisdictions also generally recognize various forms of limited liability entities, though the specific contours vary. This guidance document does not attempt to catalogue non-U.S. law. If the ISAO desires to establish a foreign legal entity, local legal counsel should be consulted.

735

736  
737  
738  
739  
740  
741

- **Tax liabilities**—How much of a concern is the ability to avoid separate tax liabilities for the ISAO itself? Some entities, such as limited liability companies and partnerships in the United States, have the advantage of “pass-through” tax liability, meaning that tax liability passes through to the individual member-owners or partners of the entity, who report the profits (or losses) on the individual tax returns.

742  
743  
744  
745

Foreign jurisdictions also generally recognize various forms of “pass-through” taxation, though the specific contours vary. This guidance document does not attempt to catalogue non-U.S. law. If the ISAO desires to establish a foreign legal entity, local legal counsel should be consulted.

746  
747  
748  
749  
750  
751  
752

- **Formal governance structure**—What type of legal entity will best address the needs and requirements of the ISAO? For example, a very large ISAO with significant resources may consider incorporating under local or state law, providing the most formal governance structure and clearest protection from liability; in contrast, a smaller ISAO that simply needs the ability to conduct business as a separately recognized legal entity may require a less formal structure, or one with greater governance flexibility, such as an LLC.

753  
754  
755  
756  
757

The ISAO should also consider whether benefactors, regulators, and other third parties with whom the ISAO may desire to interact and contract may have greater comfort with corporations, as compared to LLCs, as a result of the larger and more developed body of statutory and case law relating to corporations.

## 758 **FORMING A LEGAL ENTITY**

759  
760  
761  
762  
763  
764

When forming a legal entity, certain high-level topics should be considered. This guidance document focuses on corporations and limited liability companies, which are two of the most common legal entities in the United States. The ISAO should consult with local legal counsel for more detailed information regarding the appropriate legal structure, to assist in entity formation, and to draft the necessary documentation.

765  
766  
767  
768  
769  
770  
771

- **Filing to establish a legal entity**—To formally create a legal entity, it is necessary to file a certificate, charter, articles of incorporation, or other similar documentation (the contours of which are generally governed by local or state law) in the state where you choose to incorporate (in the case of a corporation) or organize (in the case of an LLC). In the United States, these are commonly called the certificate of incorporation or articles of incorporation (for a corporation) or certificate of formation or articles of organization (for an LLC).

772  
773  
774  
775  
776  
777

Formation documentation typically contains only basic information, such as the ISAO’s name and registered address. Corporations must also provide their articles of incorporation (name, registered address, purpose, board of directors). For-profit corporations authorize the total number of shares that the corporation may issue. Not-for-profit or non-profit corporation formation requirements vary by the state in which the corporation is established.

- 778
- 779
- 780
- 781
- 782
- 783
- 784
- 785
- 786
- **Operating agreement**—The operating agreement (for LLCs) or bylaws (for corporations) are the primary documents establishing how the entity will be managed. This includes defining the rights and obligations of members or shareholders—and the managers or board of directors (if any)—creating officer positions, and delegating management responsibilities as appropriate. Whereas an operating agreement is a very flexible contract among members of an LLC, the bylaws of a corporation may be more limited in scope by local law, making it necessary to enter into additional “member” or “shareholders” agreements” in certain circumstances.

787

## **FOR A FOR-PROFIT CORPORATION**

- 812
- 813
- 814
- 815
- 816
- 817
- 818
- **Shareholders vs. members**—The owners of the corporation are its shareholders, whereas the owners of a limited liability company are referred to as its members. The following are items an ISAO should consider with regard to shareholders or members:
    - Who may be a shareholder or member? Should this be limited to domestic private companies and individuals, or may it also include public interest entities and foreign companies and individuals?
    - How do shareholders or members join? Are there initial or continuing capital contribution requirements?
    - What are the ongoing rights and obligations of shareholders and members (including management of the organization, capital contributions, and information sharing, among others)?
    - When and where will shareholders or members meet? May actions by shareholders or members be decided only at a meeting, or also by written consents, and how will voting (and veto) rights be defined?
  - **Board of directors**—Corporations are typically managed by a board of directors elected by the shareholders, while LLCs are often member-managed. However, LLCs may also establish a board of directors, as the members see fit. The operating agreement or bylaws should establish the board of directors, if any. The following are key considerations when establishing the board of directors:
    - Structure—What will be the size of the board, and who will be the initial founding directors? How will directors be chosen in the future, and when will elections take place? Will there be term limits or other requirements or qualifications of directors?
    - Delegations of duties—What management rights will be within the purview of the directors? What actions will require additional approval by the shareholders or members?
    - Meetings and voting—When and where will directors meet? May official actions be decided only at a meeting, or also by written consent and in meeting minutes? How will voting (and veto) rights be defined?

- 819
- 820
- 821
- 822
- **Officers**—Corporations and LLCs may also appoint officers to manage the day-to-day operations of the entity. In certain circumstances, it may also be necessary to appoint officers to take certain actions on behalf of a corporation, such as executing leases or financing agreements.
    - **Officer titles**—Corporations will typically have a president, secretary, and treasurer, and may also have vice-presidents.
    - **Delegation of responsibilities**—When establishing the board of directors, the operating agreement or bylaws should define and delegate those responsibilities to the officers or shareholders or members, as deemed appropriate. Term limits, the manner of election or appointment and any other rights, duties, or qualifications should also be considered.
  - **Committees**—In certain circumstances, it may also be beneficial to establish committees of the board of directors (the members of which are typically directors), to which particular duties may be delegated. Areas uniquely suited to oversight by experts (such as audit or other financial matters) or smaller more nimble groups (such as certain special projects or transactions) may benefit from this governance structure.
  - **Delegation of responsibilities**—When establishing the board of directors, the operating agreement or bylaws should define and delegate those responsibilities to the committees or shareholders or members as deemed appropriate. Committees will typically also be governed by their own charter establishing committee purpose, membership, term limits, elections, meetings, voting rights, deliverables, etc.

## 842 **5.5 DESCRIBING ISAO CAPABILITIES**

843 ISAO capabilities are chosen by the organization and support the needs of its  
844 members. The capabilities generally fall into three types: foundational, additional,  
845 and unique. Most ISAOs will have capabilities chosen from some distinctive com-  
846 bination of these three types. As an example, a small group wanting to establish  
847 an ISAO may choose primarily foundational capabilities, in order to meet pro-  
848 jected membership requirements.

- **Foundational** capabilities are generally considered fundamental in nature for most ISAOs, depending on the needs of its members. Foundational capabilities are those from which most ISAOs might find a larger number of applicable capabilities to consider for serving their members. They might include using a standard method to send and receive cyber threat indicators, vetting members (a trust capability), and storing threat indicator information, to name a few.
  - **Additional** capabilities typically might encompass those which further differentiate the ISAO or meet the needs and constraints of its particular operational or business environment, driven by its own member needs. Additional capabilities tend to represent enhanced capabilities beyond those afforded by
- 849
- 850
- 851
- 852
- 853
- 854
- 855
- 856
- 857
- 858
- 859

860 foundational capabilities, in the case of most ISAOs, as they construct a port-  
861 folio of capabilities designed to address the needs of their members. An ex-  
862 ample might include analysis of incoming cyber information in order to assess  
863 its relevance to membership needs.

864 • **Unique** capabilities are special functions or activities developed or adopted  
865 by the organization itself to meet its own particular needs or opportunities.  
866 Unique capabilities are those that are not otherwise identified as foundational  
867 or additional. This construct deliberately refrains from specifying particular  
868 unique capabilities, because these are the specific capabilities that ISAOs de-  
869 sign and apply for their members. In other words, a unique capability is elec-  
870 tively created and applied by any individual ISAO, but has a common lexicon  
871 term to describe its type (unique) that is understood by all ISAOs. The exist-  
872 ence of the term “unique” within the lexicon of this construct enables all mem-  
873 bers of the ISAO sharing community to understand immediately the type of  
874 capability being discussed, applied, or considered so that best practices, re-  
875 search, event programming, and development of active defense and resili-  
876 ence doctrine is better enabled. They might include understanding effective  
877 firewall settings, growing mentor-protégé opportunities, or instituting listserv  
878 mechanisms.

879 Capabilities an ISAO decides to choose depend on the service it wishes to pro-  
880 vide to its members. There is no requirement to “package” or select any specific  
881 capability or groups of capabilities—it is a pick-and-choose environment. Experi-  
882 ence may well reveal certain capabilities that all or most organizations consider  
883 essential in actual practice for an effective and secure information sharing part-  
884 nership.

885 The ISAO SO will develop a common lexicon to describe the capabilities so there  
886 will be an understanding of each capability in order to accelerate adoption and  
887 improve the ability for collaboration. Additionally, a common lexicon supports op-  
888 erational techniques, as well as procedural and doctrinal development, while fuel-  
889 ing innovation. The better everyone understands ISAO capabilities in advance,  
890 the more we can accelerate and support an overall ecology of trusted sharing.  
891 This is because ISAOs—which include Information Sharing and Analysis Centers  
892 (ISACs)—that see a known indicator of recognized trusted sharing and analytic  
893 capabilities (a “Basic Voluntary Capability,” as explained below) will instantly rec-  
894 ognize it and can form collaborative partnerships and trusted relationships more  
895 readily and quickly than they otherwise might. This approach leverages the  
896 proven experience that well-crafted and minimal standardization can actually im-  
897 prove diversity and trusted collaboration. It acts as an accelerant and catalyst to  
898 prospective partners who will share data and knowledge for benefit of the entire  
899 ISAO community.

900 For this reason, we will develop a one-page *standard descriptive form* that states  
901 an ISAO’s name, mission, purpose, and particular capability using a common lex-

902 icon built on the scheme of foundational, additional, and unique capabilities of-  
903 ferred in this document. One portion of that form could contain a standard and  
904 recognizable icon representing the Basic Voluntary Capability. That symbol  
905 would reassure potential partners about the organization’s understanding of the  
906 capability level, thereby increasing the probability that trusted collaborative rela-  
907 tionships will form which are mutually productive for not only the partner organi-  
908 zations but also the ISAO community as a whole. This is the intent of the ISAO  
909 voluntary standards development effort.

910 The *standard descriptive form* would avoid:

- 911 • Statements of any particular requirements for any ISAO, because all stand-  
912 ards and guidelines are voluntary.
- 913 • Issues involving complexity or excessively detailed information.

914 This approach would feature:

- 915 • A comprehensive roadmap, informed by subject matter expertise, to consider  
916 for ISAO development that invites formation and informs sustainment.
- 917 • A standard lexicon and model to accelerate collaborative innovation within the  
918 growing community of ISAOs.
- 919 • A common lexicon that addresses, specifically names, and invites—but does  
920 not constrain or restrain—ISAO-specific and member-driven innovation and  
921 customization.
- 922 • A way ahead to standardize and simplify an essential ISAO Basic Voluntary  
923 Capability in order to accelerate ISAO partnering for trusted collaboration, a  
924 key resilience benefit, by using a universally understood approach to make it  
925 more efficient.
- 926 • An achievable, elective, and aspirational component to encourage a basic ca-  
927 pability. New and evolving ISAOs might aspire to attain the Basic Voluntary  
928 Capability, but they would not be required to select its use because it is volun-  
929 tary. ISAOs that do develop the Basic Voluntary Capability may find benefits  
930 that accrue for their members from more efficient ISAO collaborative partner-  
931 ships and that may accelerate trusted relationships.

932 The following are among the foundational capabilities that a Basic Voluntary Ca-  
933 pability should indicate:

- 934 • Administering day-to-day operations and providing sufficient support to mem-  
935 bers.
- 936 • Vetting new members. This is one aspect of demonstrating trustworthiness  
937 and credibility to current and potential members, as well as to partners.

- 938 • Enabling members to collaborate and share information among themselves  
939 and with ISAO administrators or analysts. This may include the capability to  
940 send and receive suspicious activity reports (SARs) and incident reports.
- 941 • Analyzing incoming information to assess its relevance to members and impli-  
942 cations for them.
- 943 • Managing and sharing restricted or otherwise sensitive information in a way  
944 that respects originators' preferences. This might include binding members to  
945 an information sharing policy.
- 946 • Disseminating information to members. Possible mechanisms include, but are  
947 not limited to, face-to-face meetings, secure portals, mailing lists and other  
948 email distribution platforms, online discussions, message boards, webinars  
949 and chat applications.

950 The capabilities represented by the above Basic Voluntary Capability are among  
951 the foundational capabilities that new and evolving ISAOs might choose to select,  
952 along with other additional and unique capabilities, in any mix they deem appro-  
953 priate to the needs of their members, the threat and vulnerability environment  
954 they face, and the resources and constraints of their particular organization.

955 This model means that every ISAO can be described in a standard manner that  
956 consists of:

- 957 • A discrete core capabilities statement summarizing the organization's distinc-  
958 tive blend of descriptive foundational, additional, and unique capabilities,  
959 which could be numbered or digitized for reference.
- 960 • Basic Voluntary Capability (if chosen by the ISAO) expressed through a rec-  
961 ognizable, accepted icon, to promote sharing and inter-ISAO collaboration;  
962 and a standard, one-page Basic Voluntary Capability template summary for  
963 reference and doctrinal development for operationalized resilience (unity of  
964 effort and message).
- 965 • Compatibility with measures of effectiveness. All ISAOs can be described in a  
966 standard lexicon and format that specifically identifies each capability by type  
967 and number. That being the case, research products and resilience plans can  
968 benefit from the fact that capabilities application may be further enhanced by  
969 digital processing and automated sharing for the benefit of the ISAO commu-  
970 nity and the nation. The result is a standard lexicon construct that supports  
971 continuous improvement in operationalized resilience for the ISAO community  
972 as a whole.

973

## 974 5.6 CATEGORIES OF ISAOs

975 Four strategic drivers—information sharing, analytics, member value delivery,  
976 and business and IT operations—support the various core capability areas. Addi-  
977 tionally, there are three types of capabilities: foundational, additional, and unique.  
978 All have been tied together within a comprehensive structure of *voluntary* stand-  
979 ards and guidelines that use a common lexicon and a way for prospective trusted  
980 collaboration partner organizations to identify a set of capabilities. This section  
981 discusses the types of ISAOs that may emerge; the intent is to *describe, not pre-*  
982 *scribe*, what ISAOs might look like as they develop over time.

983 Although there will be many variations of ISAOs, all will fall into one of the four  
984 categories described below, each with different characteristics, attracting differ-  
985 ent participants, and having different capabilities. A second factor considers de-  
986 grees of trust, which may be gauged in many ways. Examples may include  
987 possession of security clearances, vetting of members, non-disclosure agree-  
988 ments, and other contractual arrangements. When an ISAO is operating within  
989 the framework of a larger response organization, the ISAO’s host or sponsoring  
990 organization might ask for its operation to be aligned with higher level guidance,  
991 which promotes unity of effort and message.

992 Examples include the methods for response used by established ISACs, method-  
993 ologies and procedures used by the DHS National Cybersecurity and Communi-  
994 cations Integration Center (NCCIC), and other proven processes. In these  
995 instances, an ISAO will be in a category such as “industry or technology” and  
996 have capabilities that support its operation.

997 To restate, this section provides a high-level description of the different catego-  
998 ries of ISAOs going forward. The list is non-exhaustive and illustrative only. Our  
999 proposed model, which contains numerous capabilities, could identify any spe-  
1000 cific requirements there as unique that are not already identified within the pro-  
1001 posed foundational or additional capabilities. In these instances, an ISAO may be  
1002 in any of the below categories. It is important to remember that some ISAOs, in  
1003 the individual and/or informal group-based category, may wish to have minimal  
1004 capabilities and choose to receive cyber threat information by means of email or  
1005 other less complex means. In the end, what matters is improving the U.S. cyber-  
1006 security posture.

### 1007 5.6.1 EXAMPLE 1: INDIVIDUALS OR INFORMAL GROUP-BASED

1008 **Characteristics:** A single entity, event-driven (such as a new virus or malware  
1009 requiring a group formed ad hoc to respond); or an informal collection of organi-  
1010 zations or individuals with limited sharing in scope or duration and analysis objec-  
1011 tives, infrequent sharing of information, information obtained from public sources  
1012 or other similar ISAOs or between members; generally little or no tailored infor-  
1013 mation analysis or incident response.

1014           **Examples:** A self-employed security consultant; a localized group of profession-  
1015           als; a rapidly convened or issue-driven ISAO.

## 1016   **5.6.2 EXAMPLE 2: INDUSTRY- OR SECTOR-BASED**

1017           **Characteristics:** Groups of organizations (public, private, or blended) or a pri-  
1018           vate company sharing a common interest, goal, or purpose. Some members may  
1019           be capable of sharing information with federal and law enforcement entities at  
1020           classified levels. The industry or sector size may vary greatly. Examples might be  
1021           a small town, an unaffiliated bank, a software consulting firm, or a government  
1022           contractor. Information received may be from public sources or members. The or-  
1023           ganization might perform ISAC or other ISAO incident response coordination,  
1024           perhaps as part of government response frameworks (such as DHS NCCIC) that  
1025           consist of both public- and private-sector partners. It may analyze shared infor-  
1026           mation as it pertains to the ISAO and its members and other collaborative secu-  
1027           rity partners in coordination efforts.

1028           **Examples:** Southern U.S. mega churches; U.S. electronic game developers in-  
1029           dustry; existing ISACs.

## 1030   **5.6.3 EXAMPLE 3: GEOGRAPHICALLY-BASED**

1031           **Characteristics:** Members come from a geographic region and cross multiple  
1032           businesses or sectors. Some members may be able to share information with  
1033           federal and law enforcement entities at a classified level. Incident response coor-  
1034           dination is generally a significant goal of the members. Members regularly ana-  
1035           lyze government and member-shared information. Entities may provide for a  
1036           member-supported security operations center or similar shared resources or con-  
1037           tracted support.

1038           **Examples:** The State of Texas; the City of San Antonio; Bowie County.

## 1039   **5.6.4 EXAMPLE 4: OTHER**

1040           **Characteristics:** Groups of technical individuals who have an active interest in  
1041           cyber threat indicators due to their engagement of cyber defenses, or other com-  
1042           puter technology in their business. These members or groups desire to share in-  
1043           formation and, in some cases, perform analysis of threat vectors and software. It  
1044           may be that this group shares directly with the U.S. government in order to col-  
1045           lect the most current cyber threat indicator information.

1046           **Examples:** Computer security firms, cyber defense service providers.

## 1047   **5.7 CONSIDERING CAPABILITIES**

1048           An ISAO may choose capabilities that will determine its category or, inversely,  
1049           the category by which an ISAO defines itself may suggest the capabilities it may  
1050           choose to consider. Either way, ISAO capabilities and categories potentially help  
1051           inform each other, depending on the approach an ISAO chooses to best serve  
1052           the needs of its members. The voluntary standards describe possible capabilities

1053 for new and developing ISAOs to consider that may help them serve their mem-  
1054 bers, while organizing those capabilities within a comprehensive construct. The  
1055 construct further accelerates and enables future resilience efforts by offering a  
1056 standard digital-ready lexicon and a Basic Voluntary Capability, which any ISAO  
1057 can aspire to and elect to apply, and which may help accelerate the development  
1058 of trusted security collaboration for the ISAO that employs it and at ISAO commu-  
1059 nity levels writ large.

1060 We have described above three types of ISAO capabilities: foundational, addi-  
1061 tional, and unique. Although most ISAOs will likely choose to commence opera-  
1062 tions with primarily foundational capabilities, their evolution over time will  
1063 probably include relatively greater use of additional and unique capabilities that  
1064 may potentially broaden and enhance the effectiveness of information sharing  
1065 and analysis offerings for their members.

## 1066 **6 CYBERSECURITY-RELATED INFORMATION SHARING**

1067 The ISAO SO recognizes that not all new ISAOs may be capable initially of or  
1068 desire to fully achieve these objectives. This information sharing guideline is  
1069 structured to provide a new or existing ISAO with a context identifying outcomes  
1070 to be considered when selecting and implementing information sharing and col-  
1071 laboration efforts for the ISAO. In addition to a context framework and information  
1072 uses, we also present a functional decomposition of possible ISAO information  
1073 sharing activities. This guideline also offers a path to consider for evolving an  
1074 ISAO's information sharing capabilities. Note that the framework is conceptual as  
1075 opposed to prescriptive, and inclusion is meant to illustrate options rather than  
1076 mandate. Information sharing may also be supported by other future relevant  
1077 documents (statements of principle, policy documents, processes, procedures,  
1078 data standards, etc.).

### 1079 **6.1 SUPPORTING CYBERSECURITY RISK AND INCIDENT** 1080 **MANAGEMENT**

1081 Companies, enterprises, and organizations manage strategic and tactical cyber-  
1082 related risks, as a result of the technology they employ or their interaction with  
1083 others. Managing these risks entails understanding the environment in which  
1084 they are operating (situational awareness), determining directions to pursue (de-  
1085 cision-making), and detailing efforts (actions) to undertake. These are activities  
1086 an organization executes daily.

1087 With respect to cybersecurity-related information, an organization has a need for  
1088 various types of information, which we place for discussion purposes into a *con-*  
1089 *text for information sharing* with two major categories.

1090

**1091 6.1.1 TYPE OF ACTIVITY SUPPORT**

1092 The first category of information relates to the purpose for which the information  
1093 is used. While the overall purpose of information sharing is to enable effective  
1094 risk management, this can be distilled into three groups of information. These dif-  
1095 ferent groups build up to a full spectrum of risk management.

- 1096 • *Situational awareness* information provides awareness of the broader threat  
1097 landscape.
- 1098 • *Decision making* information is customized to a particular organization's  
1099 needs and enables more effective security management.
- 1100 • *Action* information directly supports the implementation of a particular meas-  
1101 ure that improves security.

**1102 6.1.2 TYPE OF INFORMATION USE**

1103 The second category of information revolves around time and the application of  
1104 resources. This type of information seeks to capture the complementary efforts  
1105 that need to occur for effective cybersecurity. It begins with information most op-  
1106 operationally relevant to security and builds upon it.

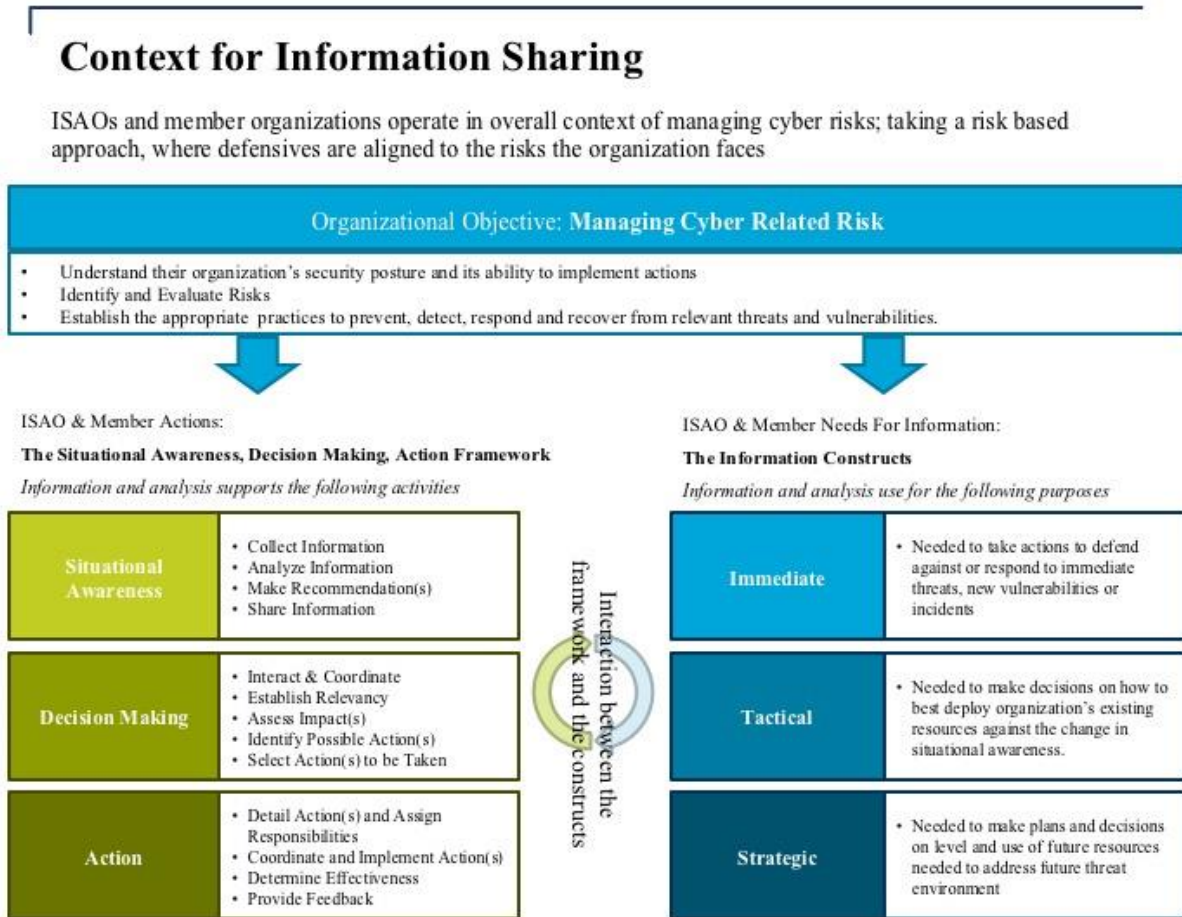

- 1107 • *Immediate* information relates to actions to defend against or respond to new  
1108 threats, vulnerabilities, or incidents.
- 1109 • *Tactical* information relates to decisions on how to best deploy organization's  
1110 existing resources against the change in situational awareness.
- 1111 • *Strategic* information relates to making plans and decisions on efforts and re-  
1112 sources needed to address emerging or future threat environments.

1113 The situational awareness, decision-making, and action framework and the infor-  
1114 mation construct levels are depicted in Figure 2. Conceptually, a mature ISAO  
1115 will have a close and interactive relationship between the framework an organiza-  
1116 tion is executing and the information sharing construct levels an ISAO is perform-  
1117 ing.

1118

Figure 2. Context for Information Sharing

1119

## 6.2 ISAO INFORMATION SHARING VALUE PROPOSITION

1120

1121

1122

1123

1124

Fundamental to the establishment of an ISAO will be the “value proposition” to be offered its participants, partners, and collaborators and the specific categories of information to be collected, disseminated, and shared. The following guidance can assist ISAOs as they develop their information sharing policy considerations.

1125

1126

1127

Using the activities and categories of information discussed previously, an ISAO can consider and respond to the questions below to begin establishing an information sharing policy.

1128

1129

- Which categories of information does the ISAO want to provide members to give them *situational awareness* relevant to their affinity group?

1130

1131

- Will the ISAO provide raw data, analysis, or both to assist members in their *tactical decision-making* efforts?

1132

1133

1134

- Will members expect information related to *action* recommendations, including defensive measures, best practices, and/or procedures for incident coordination?

1135 • Will the ISAO provide analysis of a *strategic* nature related to trending analy-  
 1136 sis and threat actor targeting and motivation?

1137 In the context of the framework and information construct levels, Figure 3 pre-  
 1138 sents various interactions to consider as an ISAO develops its information shar-  
 1139 ing objectives and policies.

1140 *Figure 3. Levels of Information Related to Activity Framework*

### Conceptual ISAO Framework

	Situational Awareness	Decision Making	Action
<b>Immediate</b> <i>(Taking actions against immediate threats/new vulnerabilities/ incidents)</i>	<b>ISAO Action:</b> <ul style="list-style-type: none"> <li>Collect information on threats, vulnerabilities, and incidents.</li> <li>Analyze information and make recommendations</li> <li>Share information with members</li> </ul> <b>Member Org. Action:</b> <ul style="list-style-type: none"> <li>Collect information and share with ISAO</li> <li>Receive information from ISAO</li> </ul>	<b>ISAO Action:</b> <ul style="list-style-type: none"> <li>Assess potential impact for all members</li> <li>Response to member queries</li> <li>Coordination between members</li> <li>Propose/assess possible actions</li> </ul> <b>Member Org. Action:</b> <ul style="list-style-type: none"> <li>Establish relevancy</li> <li>Assess impact</li> <li>Review potential actions</li> <li>Select actions to take</li> </ul>	<b>ISAO Action:</b> <ul style="list-style-type: none"> <li>Support response to threats</li> <li>Coordinate joint response</li> <li>Assess impact of actions</li> </ul> <b>Member Org. Action:</b> <ul style="list-style-type: none"> <li>Respond to shared information</li> </ul>
<b>Tactical</b> <i>(Using existing resources to protect against changes in situational awareness)</i>	<b>ISAO Action:</b> <ul style="list-style-type: none"> <li>Create overall view of current situational awareness and defensive measure practices</li> <li>Consolidate, enrich, analyze information and make recommendations</li> <li>Share information with members</li> </ul> <b>Member Org. Action:</b> <ul style="list-style-type: none"> <li>Receive information from ISAO</li> <li>Interact with other members</li> <li>Share defensive measures</li> </ul>	<b>ISAO Action:</b> <ul style="list-style-type: none"> <li>Assess potential impact for all or specific members</li> <li>Response to member queries</li> <li>Coordination between members</li> <li>Propose/assess possible actions</li> </ul> <b>Member Org. Action:</b> <ul style="list-style-type: none"> <li>Establish relevancy</li> <li>Assess impact of existing defensive measures against threat updates and situational awareness changes.</li> <li>Review potential actions</li> <li>Select actions to take</li> </ul>	<b>ISAO Action:</b> <ul style="list-style-type: none"> <li>Support implementation</li> <li>Coordinate joint actions</li> <li>Assess impact of actions</li> </ul> <b>Member Org. Action:</b> <ul style="list-style-type: none"> <li>Implement decided course of action</li> <li>Review and adjust</li> </ul>
<b>Strategic</b> <i>(Changing resources based on future threat environment)</i>	<b>ISAO Action:</b> <ul style="list-style-type: none"> <li>Trend analysis on information</li> <li>Publish in-depth analysis</li> <li>Share information with members</li> </ul> <b>Member Org. Action:</b> <ul style="list-style-type: none"> <li>Receive information from ISAO</li> <li>Interact with other members</li> <li>Share strategies and plans</li> </ul>	<b>ISAO Action:</b> <ul style="list-style-type: none"> <li>Response to member queries</li> <li>Coordination between members</li> <li>Propose/assess possible actions</li> </ul> <b>Member Org. Action:</b> <ul style="list-style-type: none"> <li>Assess existing resources against future threat environment</li> <li>Benchmark against peers</li> <li>Set strategy/plans</li> </ul>	<b>ISAO Action:</b> <ul style="list-style-type: none"> <li>Support implementations</li> <li>Coordinate joint strategies</li> <li>Assess impact of actions</li> </ul> <b>Member Org. Action:</b> <ul style="list-style-type: none"> <li>Implement selected strategy</li> <li>Review and adjust decisions and actions</li> </ul>

1141  
 1142

### 6.3 CATEGORIES OF INFORMATION AN ISAO MAY WANT TO SHARE

1143 There are several key factors to consider when evaluating the categories of  
 1144 cyber threat information an ISAO may want to share. In addition, there are vari-  
 1145 ous ways to share that information, including machine to machine, human to hu-  
 1146 man, or human to machine. Machine-to-machine sharing requires structured  
 1147 information and should utilize standardized data formats and protocols to enable  
 1148 interoperability. Human-to-human sharing should utilize a common framework for  
 1149 describing cyber threat information to facilitate shared understanding among  
 1150  
 1151

1152 members, but the information may naturally be less structured than what is re-  
1153 quired for machine-to-machine sharing.

1154 ISAOs and their members may wish to share information across ISAOs, with  
1155 other ISAO members, and with the various government entities. Consistent  
1156 standardized frameworks and data formats should be used when possible to fa-  
1157 cilitate these diverse cross organization information exchanges. Additionally, lev-  
1158 eraging a consistent framework will enable integration and analysis of threat  
1159 information from disparate sources that may have different focuses, like integrat-  
1160 ing indicator information with threat actor or incident information.

1161 The Structured Threat Information eXpression (STIX) language is one of a few  
1162 commonly used languages for capturing and sharing cyber threat information.  
1163 STIX defines a broad framework for expressing and sharing cyber threat infor-  
1164 mation in a consistent manner. This framework consists of a set of core concepts  
1165 (threat actors, campaigns, TTPs, incidents, indicators, course of actions, observ-  
1166 ables, and exploit targets) and the set of relationships among those core con-  
1167 cepts. The STIX framework is broad to support the full scope of cyber threat  
1168 intelligence use cases and flexible to allow users or communities to define the  
1169 subset of the STIX language that they need for their use cases. Trusted Auto-  
1170 mated eXchange of Indicator Information (TAXII) defines a standardized set of  
1171 services to enable the exchange of cyber threat information. STIX and TAXII  
1172 were developed through active collaboration with dozens of organizations, includ-  
1173 ing threat intelligence teams from government and industry, security product and  
1174 service vendors, ISACs, and major Computer Emergency Response Teams  
1175 (CERTs). ISAOs should consider utilizing STIX and TAXII for automated ex-  
1176 changes of cyber threat information.

1177 The STIX language enables users to define profiles for specific cyber threat shar-  
1178 ing needs. These profiles simply document which subset of the STIX language  
1179 will be used. When using STIX, it is helpful for ISAOs to develop or leverage well  
1180 known STIX profiles to document the specific data elements to be exchanged in  
1181 a given scenario.

1182 STIX data model documentation is available here:  
1183 <https://stixproject.github.io/data-model/>

1184 STIX profile documentation is available here:  
1185 <https://stixproject.github.io/documentation/profiles/>

1186 To ensure that members are sharing and receive information valuable to them  
1187 and others, ISAOs and their members should consider systematically determin-  
1188 ing what information to share and how to share it. ISAOs should consider estab-  
1189 lishing periodic reevaluations of this to ensure that member needs are being met.

1190 CORA<sup>3</sup>—Cyber Operations Rapid Assessment—is a method developed to rap-  
1191 idly assess an organization’s cyber operations and provide actionable recom-  
1192 mendations for the collection, utilization, and sharing of threat information. A  
1193 CORA assessment can help both the organization being assessed and a cyber  
1194 threat information provider or ISAO by helping the provider understand the as-  
1195 sessed organization’s capabilities and needs. BLAISE<sup>4</sup>—Bilateral Analysis of In-  
1196 formation Sharing Efforts—was developed to analyze information sharing efforts  
1197 and determine their expected effectiveness. ISAOs should use methodologies  
1198 like CORA and BLAISE to ensure that the information sharing aligns with mem-  
1199 ber needs and capabilities.

1200 The following sections describe commonly shared cyber threat information that  
1201 an ISAO may wish to share. When applicable, these sections have been aligned  
1202 with the terminology and definitions used in STIX.

### 1203 **6.3.1 CAMPAIGNS**

1204 Campaign information can relate information about intended effects of an adver-  
1205 sary or group with the tools they employ, the threat actors that are believed to  
1206 participate, incidents that have been associated with the group, and other related  
1207 campaigns.

1208 The following fields are commonly shared:

- 1209 • Names—Short names or alias used for the campaign
- 1210 • Description
- 1211 • Intended effects—Military, economic, or political advantage, theft, destruction,  
1212 disruption, etc.
- 1213 • Related TTPs
- 1214 • Related incidents
- 1215 • Associated campaigns
- 1216 • Attribution (related threat actors).

1217 Tracking and sharing campaign information is critical for cyber threat intelligence  
1218 analysis. This information allows organizations to develop an understating of the  
1219 threats they face as well as the specific objectives and capabilities that an adver-  
1220 sary or group is believed to have employed. Sharing campaign information  
1221 among organizations can help all participants develop a much more comprehen-  
1222 sive understanding of these threats.

---

<sup>3</sup> <https://www.mitre.org/publications/technical-papers/cyber-operations-rapid-assessment-cora-examining-the-state-of>

<sup>4</sup> <http://dl.acm.org/citation.cfm?id=2663880>

1223 Organizations may be reluctant to include attribution information when sharing  
1224 campaign information due to its sensitive nature. Sharing campaign attribution in-  
1225 formation is not always necessary to facilitate a broader understanding of a given  
1226 campaign.

1227 Campaign information often comes from government or industry cyber threat in-  
1228 telligence sources. More established sharing organizations including ISACs may  
1229 operate their own cyber threat analysis teams and track campaigns that are rele-  
1230 vant to managing their cyber security risk or risk to their members.

1231 Campaign information is frequently more strategic in nature and used to inform  
1232 situational awareness and decision making.

### 1233 **6.3.2 THREAT ACTORS**

1234 Threat actor information describes malicious actors that may represent a cyber  
1235 threat or have been historically observed or related to known incidents.

1236 The following fields are commonly shared:

- 1237 • Names—Short names or alias used for the threat actor
- 1238 • Description—A textual description of the threat actor
- 1239 • Identity—Information that may identify the actor
- 1240 • Type—Hacker, hacktivist, state actor, electronic crime actor, insider threat,  
1241 etc.
- 1242 • Motivation—Political, economic or financial, ideological, military, etc.
- 1243 • Sophistication—Novice, practitioner, expert, innovator, etc.
- 1244 • Intended effects—Military, economic, or political advantage, theft, destruction,  
1245 disruption, etc.
- 1246 • Observed TTPs—TTPs that an actor has been observed to use
- 1247 • Related campaigns—Campaigns that have been attributed to the actor.

1248 Tracking and sharing threat actor information is critical for cyber threat intelli-  
1249 gence analysis. This information allows organizations to develop an understating  
1250 of the threats they face as well as the specific objectives and capabilities that an  
1251 adversary or group is believed to have employed. Sharing threat actor infor-  
1252 mation among organizations can help all participants develop a much more com-  
1253 prehensive understanding of these threats.

1254 Threat actor information often comes from government or industry cyber threat  
1255 intelligence sources. More established sharing organizations including ISACs  
1256 may operate their own cyber threat analysis teams and track threat actors rele-  
1257 vant to managing their cyber security risk or risk to their members.

1258 Threat actor information is frequently more strategic in nature and used to inform  
1259 situational awareness and decision making.

### 1260 **6.3.3 TACTICS, TECHNIQUES, AND PROCEDURES (TTPs)**

1261 TTPs represent a fairly broad set of information that can be used to describe the  
1262 behavior or capabilities of a threat actor of campaign. TTPs characterize what  
1263 adversaries do and how they do it. As such, TTPs encompass specific adversary  
1264 behaviors, resources leveraged, target victim information, and vulnerabilities or  
1265 weaknesses being targeted.

1266 The following fields are commonly shared:

- 1267 • Title
- 1268 • Description
- 1269 • Intended effect
- 1270 • Behavior—Specific attack patterns, malware, or exploits
- 1271 • Resources—Tools, infrastructure, or personas
- 1272 • Victim targeting—People, organizations, information or access being targeted
- 1273 • Kill chain phase
- 1274 • Related TTPs.

1275 Malware samples represent one commonly shared type of TTP. Sharing malware  
1276 samples can enable broad distributed analysis of the sample as well as higher  
1277 level trending of both malware and the types of organizations being targeted.

1278 TTPs are a critical component to cyber threat intelligence analysis and they are  
1279 frequently related or shared in the context of incidents to describe the TTPs de-  
1280 tected during an incident investigation. Cyber threat indicators relate low-level  
1281 observables to TTPs to give context to what defenders should look for. Cam-  
1282 paigns and threat actors are often related to TTPs to characterize either previ-  
1283 ously observed or expected adversary capabilities.

1284 Aggregated TTP information can enable cyber threat analysts to develop a more  
1285 holistic understanding of the threat or more narrowly advance the understanding  
1286 of a specific adversaries. This information may inform strategic, tactical, and im-  
1287 mediate situational awareness, decision making, and actions.

### 1288 **6.3.4 INCIDENTS**

1289 Incident information is specific information related to or discovered while investi-  
1290 gating or responding to a cybersecurity incident. The amount and level of detail  
1291 included in shared incident information varies widely depending upon the in-  
1292 tended use of the shared information and sensitivities related to financial, reputa-  
1293 tional or other negative impacts of incident disclosure.

- 1294 The following fields are commonly shared:
- 1295 • Title
  - 1296 • Description
  - 1297 • Category—Improper usage, scanning or probing, denial of service, etc.
  - 1298 • Reporter—The reporting source of the incident description
  - 1299 • Victim—Details about the victim of the incident
  - 1300 • Affected assets—Describes the assets that were affected during the incident
  - 1301 • Impact assessment—Describes the impact of the incident
  - 1302 • Related indicators—IP addresses, file hashes, domains, etc.
  - 1303 • Leveraged TTPs—Attack techniques, malware, tools, etc.
  - 1304 • Attributed threat actors
  - 1305 • Intended effect—Theft, disruption, account take over, fraud, etc.
  - 1306 • Related incidents
  - 1307 • Courses of action.

1308 The U.S. government publishes several well-known guides for reporting incident  
1309 information and incident handling.

1310 US-CERT has established the following guidelines for incident notification:  
1311 <https://www.us-cert.gov/incident-notification-guidelines>

1312 The National Institute of Standards and Technology (NIST) has a special publica-  
1313 tion on incident handling:  
1314 <http://nvlpubs.nist.gov/nistpubs/SpecialPublications/NIST.SP.800-61r2.pdf>

1315 These are excellent references for the type of information that is commonly  
1316 shared to support incident response and analysis.

1317 Sharing incident information can enable or support a wide variety of use cases  
1318 and different use cases will naturally have different incident information require-  
1319 ments. Incident information sharing can enable large scale analysis to uncover  
1320 adversary trending across the cybersecurity ecosystem. Detailed incident infor-  
1321 mation sharing may enable advanced cyber threat intelligence analysis related to  
1322 specific threat actors and campaigns. Incident information sharing can also help  
1323 uncover key indicators of malicious activity to inform partner cyber defenses.

1324 One well-known example of large scale incident analysis enabled by the sharing  
1325 of detailed incident information is Verizon’s Data Breach Investigations Report.<sup>5</sup>

---

<sup>5</sup> <http://www.verizonenterprise.com/verizon-insights-lab/dbir/2016/>

1326 This report is the result of analyzing a large collection of incident information con-  
1327 tributed by a variety of organizations. This report is oriented toward providing  
1328 strategic and tactical value to inform situational awareness and decision making.

### 1329 **6.3.5 INDICATORS**

1330 Indicators convey specific patterns combined with contextual information in-  
1331 tended to represent artifacts and/or behaviors of interest within a cyber security  
1332 context and are used for detecting activity of interest. Indicators are widely  
1333 shared today, with examples ranging from malicious file hashes to command and  
1334 control IP addresses, phishing emails, and other types.

1335 Effective indicator sharing includes contextual information to allow downstream  
1336 consumers to determine whether an indicator is relevant to their organization,  
1337 how to handle the indicator, what TTP is indicated, the valid time window of the  
1338 indicator, and related incidents, threat actors, and campaigns.

1339 The following fields are commonly shared:

- 1340 • Title
- 1341 • Description
- 1342 • Pattern—The machine readable pattern
- 1343 • Confidence—The level of confidence in the indicator
- 1344 • Indicated TTP
- 1345 • Valid time position—The time window for which the indicator is valid.

1346 Indicator sharing tends to focus on machine-to-machine information exchanges.  
1347 One example of automated indicator sharing is the DHS-operated [Automated In-  
1348 dicator Sharing \(AIS\) initiative](#) to enable cyber threat sharing among the federal  
1349 government departments and agencies and the private sector. This initiative uti-  
1350 lizes STIX and TAXII for the automated exchange of cyber threat information and  
1351 has defined a profile of the STIX language for indicator exchange. The AIS STIX  
1352 profile documents the specific data elements of the STIX language that will be  
1353 used for AIS cyber threat sharing. This provides a good starting point for basic  
1354 cyber threat indicator sharing and can be easily leveraged to establish a con-  
1355 sistent approach to sharing indicators within and among ISAOs.

1356 Indicators are often generated through malware analysis, incident response, and  
1357 endpoint and network monitoring. As such, indicator information frequently  
1358 comes from a variety of sources including ISACs, CERTs, security product and  
1359 service vendors, organization-specific security teams, and open source reporting.  
1360 This variety of sources of indicator information adds emphasis to the need to  
1361 convey contextual information with shared indicators. A common challenge to in-  
1362 dicator sharing today is simply determining which indicators are relevant.

1363 When sharing indicators there is an opportunity to capture basic indicator sight-  
1364 ing information. That is simply a report that a given indicator matched or was  
1365 seen within some sector or even specific organization. In aggregate this sighting  
1366 information can assist in understanding the prevalence, targeting information,  
1367 and more. This aggregate sighting information widely seen as a low-cost and  
1368 low-risk method of supporting more sophisticated cyber threat intelligence analy-  
1369 sis.

### 1370 **6.3.6 VULNERABILITY INFORMATION**

1371 Vulnerability information may include details about the vulnerabilities in specific  
1372 systems or infrastructure, specific application vulnerabilities, or general classes  
1373 of vulnerabilities.

1374 The following fields are commonly shared:

- 1375 • Title
- 1376 • Description
- 1377 • Vulnerability ID—A reference to a Common Vulnerabilities and Exposures  
1378 threat or other well-known identifier
- 1379 • Score—A Common Vulnerability Scoring System rating or similar score for  
1380 the referenced vulnerability
- 1381 • Affected software.

1382 Mature software vendors routinely publish vulnerability information related to their  
1383 products and services. Many governments issue vulnerability reports or security  
1384 advisories to raise awareness as well. The US-CERT alerts<sup>6</sup> are one example of  
1385 these government advisories.

1386 Shared vulnerability information frequently informs immediate response actions,  
1387 especially when the information is related to recently discovered high-severity  
1388 vulnerabilities in exposed systems. Vulnerability trends and more general classes  
1389 of vulnerability information regularly inform tactical and strategic situational  
1390 awareness and decision making.

### 1391 **6.3.7 COURSES OF ACTION**

1392 Courses of action are specific measures to mitigate a threat or respond to an in-  
1393 cident. They may be relatively low level like blocking a specific IP address or  
1394 higher level like using application whitelisting. As such, sharing courses of action  
1395 can span the full range of immediate, tactical, and strategic information to impact  
1396 decision making and actions.

---

<sup>6</sup> <https://www.us-cert.gov/ncas/alerts>

1397 The following fields are commonly shared:

- 1398 • Title
- 1399 • Description
- 1400 • Type—Training, monitoring, patching, blocking, etc.
- 1401 • Objective
- 1402 • Impact
- 1403 • Cost
- 1404 • Efficacy
- 1405 • Course of action—Firewall or intrusion detection system rule, specific configu-  
1406 ration change, etc.

1407 Sharing courses of action can enable automated actions to mitigate threats as  
1408 well as enable organizations to collaborate and arrive at the overall best course  
1409 of action given a variety of options.

### 1410 **6.3.8 THREAT INTELLIGENCE REPORTS**

1411 Threat intelligence reports are a broad category of cyber threat information that  
1412 may range from high-level trending reports to detailed analysis of specific cam-  
1413 paigns.

1414 One well-known example of an industry-developed cyber threat intelligence re-  
1415 port is Mandiant's APT1 report<sup>7</sup> This report includes the full range of cyber threat  
1416 intelligence providing strategic, tactical, and immediate response value. The re-  
1417 port includes campaign, threat actor, TTP, and indicator information. This report  
1418 is the result of several years of analysis and tracking of cyber threats.

1419 In addition to this report and other well-known industry examples, there are nu-  
1420 merous government and open source threat intelligence reports.

### 1421 **6.3.9 ANALYSIS**

1422 Potentially important services an ISAO can choose to provide its participants are  
1423 analytical services. Many organizations focus on information sharing, but analy-  
1424 sis can also provide value to ISAO stakeholders. As noted in the framework and  
1425 information constructs described in earlier sections of this document, ISAOs can  
1426 choose from a range of analysis options to provide its participants. Participants  
1427 who engage in analysis find benefits in their immediate, tactical and strategic de-  
1428 cision-making. This section discusses analysis considerations to support immedi-  
1429 ate and tactical actions.

1430 ISAOs provide some level of continuous information flow to or among its partici-  
1431 pants. When an ISAO interprets cybersecurity information, participants receive

---

<sup>7</sup> <http://intelreport.mandiant.com>

1432 relevant and coherent intelligence that assists members in making decisions on  
1433 how to deploy operational resources. An ISAO may elect to apply its own  
1434 knowledge and expertise along with the needs of its participants to develop writ-  
1435 ten assessments.

1436 An ISAO can provide a trusted environment for its participants to encourage ana-  
1437 lysts to collaborate and share relevant information. ISAOs providing, facilitating  
1438 and leading these analysis activities can significantly increase the value of their  
1439 efforts

1440 The following are examples of informational analysis:

1441 • **Risk awareness and mitigation communications**—One of the most valued  
1442 analytical contributions an ISAO makes involves the collaboration among  
1443 ISAO participants, its analysts, and others to raise awareness and educate  
1444 participants on cybersecurity risks and approaches to be considered for miti-  
1445 gating those risks. The sharing of collective knowledge and collaboration  
1446 among expert personnel and could involve only a small number of the ISAO  
1447 participants—should result in broader communication to the ISAO partici-  
1448 pants. These “*tactical*” or operations-focused communications can provide  
1449 guidance to prevent successful attacks, identify methods or procedures to  
1450 mitigate specific risks, identify effective practices being applied by others, and  
1451 report details from participants on their experiences and effectiveness of ac-  
1452 tions they have taken.

1453 Such communications can be tailored for various audiences within the ISAO  
1454 constituency (executives, managers, and operational personnel) and deliv-  
1455 ered as required and/or as a periodic communication. Communication can  
1456 take the form of emails, reports, briefings (webinars), conference calls, and  
1457 other networking/collaboration events among participants and others. These  
1458 communications will assist those responsible for making informed decisions  
1459 for their organization.

1460 • **Alert notifications**—By examining the flow of information through an ISAO  
1461 the ISAO has the opportunity to identify new, changing, or escalating cyberse-  
1462 curity risks or incidents of particular interests to its participants and others.  
1463 This analysis can alert members and partners to urgent, crisis, or other levels  
1464 of notification and help ISAOs provide information and recommendations to  
1465 their members and partners on immediate action they can take to mitigate the  
1466 risk. Providing subsequent updated alerts and additional analysis can further  
1467 assist an ISAO, its partners, and others to understand the evolving nature of  
1468 an incident, threat, or risk.

1469 • **Incident response coordination**—Some ISAOs may envision a role of un-  
1470 derstanding and sometimes becoming actively involved in responding to cy-  
1471 bersecurity-related incidents. ISAOs may be asked by some members to  
1472 assist in incident response. In such cases, an ISAO can provide an oppor-  
1473 tunity for collaboration among analysts of member organizations to determine

1474 necessary operational coordination and the effectiveness of response actions  
1475 taken as a situation progresses and is resolved. After-action and root cause  
1476 reports can be prepared and provide valuable information that can be shared  
1477 among ISAO participants and others. If an ISAO is to assume a role in coordi-  
1478 nating incident response, it may want to consider identifying the specific value  
1479 of the ISAO's incident response function, its role in incident response, and  
1480 triggers for activating it.

1481 ISAOs at some level will all perform some form of analysis, even if it is only a de-  
1482 cision to share relevant information. In addition to the items discussed above, an  
1483 ISAO may produce other operationally oriented analysis products. Further, be-  
1484 yond these operational products, ISAOs are in a position to provide trending  
1485 analysis reporting and also strategic analysis to help those who make decisions  
1486 affecting their organization's future planning and resource requirements.

### 1487 **6.3.10 SECURITY ADVISORIES AND ALERTS**

1488 Security advisories and alerts are published by a variety of sources, including in-  
1489 ternational CERTs, governments, software and security tool vendors, ISACs, not-  
1490 for-profit organizations, and security researchers. These publications vary from  
1491 rebroadcasting of important software vendor's security advisories to tailored  
1492 products aimed to raise awareness of important new vulnerabilities and security  
1493 issues.

1494 Many of the major international CERTs provide security advisories and alerts.  
1495 For example, US-CERT publishes alerts about current security issues, vulnerabil-  
1496 ities, and exploits. These alerts attempt to describe the issue, explain the impact  
1497 of the issue, and offer a solution to address the issue. These alerts are available  
1498 at <https://www.us-cert.gov/ncas/alerts>.

1499 Similarly Aus-CERT, an organization based at the University of Queensland in  
1500 Australia, publishes two different types of security bulletins for its members.  
1501 These security bulletins are available at [https://www.auscert.org.au/ren-  
1502 der.html?cid=1](https://www.auscert.org.au/ren-der.html?cid=1).

1503 MS-ISAC is an example of an ISAC that publishes security advisories. These ad-  
1504 visories are available at <https://msisac.cisecurity.org/advisories/>.

1505 Sharing security advisories and alerts can provide the full range of immediate,  
1506 tactical, and strategic information to impact decision making and actions.

### 1507 **6.3.11 BEST PRACTICES**

1508 Sharing cybersecurity best practices among ISAO members is an important way  
1509 for organizations to collaborate and build trust, learn from each other, and collect  
1510 feedback as they mature their cybersecurity practices.

1511 ISAOs can support the interactions shown above in Figure 3 by providing their  
1512 members information needing immediate action, information of a tactical nature,

1513 and/or information of a strategic nature. There are various types of information an  
1514 ISAO and its members may want to share. This following is not an exhaustive list  
1515 of types of information and ISAO may choose to share, and there is no expecta-  
1516 tion that an ISAO share all or any of the following information. An ISAO and its  
1517 members or customers can choose to share or not share information based on  
1518 what meets the mission of the ISAO and the needs of the ISAO members. Not all  
1519 information sets are appropriate for all ISAOs or ISAO members and customers.

1520 Potential information sets an ISAO and its members could choose to share in-  
1521 clude:

- 1522 • Malicious IP addresses
- 1523 • Malware analysis
- 1524 • Automated sharing of raw threat indicators
- 1525 • Effective cybersecurity practices for a specific community or incident
- 1526 • Generic effective cybersecurity practices
- 1527 • Big data analytics
- 1528 • Attack trending and analysis
- 1529 • Assessments on specific threat actors or campaigns
- 1530 • Attacks specific companies have seen on their networks
- 1531 • Aggregated attack information from multiple customers/members
- 1532 • Those shared by for-profit company ISAOs through managed security ser-  
1533 vices
- 1534 • Single vendor vulnerability information
- 1535 • Cross-platform or multi-vendor vulnerability information
- 1536 • Vulnerability remediation tactics
- 1537 • Information on a specific, ongoing, or current cyber threat or attack
- 1538 • Threat intelligence reports developed by other parties
- 1539 • Open-source news reporting
- 1540 • Presentations and discussions from subject matter experts
- 1541 • Government alerts
- 1542 • Vendor alerts
- 1543 • Indicators of compromise
- 1544 • Threats
- 1545 • Vulnerabilities

- 1546 • Targets
- 1547 • Impacts
- 1548 • Analysis
- 1549 • Indicators of compromise
- 1550 • Tactics, techniques, and procedures
- 1551 • Incident information
- 1552 • Campaigns
- 1553 • Defensive measures and courses of action
- 1554 • Best practices
- 1555 • Trending and strategic analysis
- 1556 • Threat actor targeting and motivations
- 1557 • Existing industry practices.

## 1558 **6.4 COLLECTION, DISSEMINATION AND ANALYSIS—**

### 1559 **FUNCTIONAL DECOMPOSITION**

1560 At this point the information sharing functional components described below are  
1561 not intended to be a one-to-one mapping to the context depicted above, as the  
1562 high-level functional categories are generic and support various aspects of the  
1563 framework. The high-level categories are decomposed into sub-categories to  
1564 identify the more specific information capabilities needed to support those cate-  
1565 gories.

1566 This section describes in more detail the functional components of information  
1567 sharing an ISAO may want to consider.

1568 Participation in information sharing efforts is mainly driven by interests—either  
1569 personal, organizational, or both. Those responsible for managing cybersecurity  
1570 risks and taking actions to deal with them will participate in an ad hoc, defined, or  
1571 institutionalized information sharing activity to better understand the environment  
1572 in which they are operating and/or to contribute to collective interests.

1573 Personal or organizational interests generally value the following:

- 1574 • New knowledge for a better understanding of the threat and vulnerability envi-  
1575 ronment in which they are operating
- 1576 • Recommendations for dealing with specific threats and vulnerabilities
- 1577 • Receipt of situational alerts that may affect their security posture
- 1578 • Validation of their understanding of a current situation or incident

- 1579 • Additional information that may improve their current understanding of
- 1580 threats, vulnerabilities, and/or incidents
- 1581 • Knowledge of the actions being taken by others
- 1582 • Coordination of collective actions
- 1583 • Feedback on the effectiveness of actions being taken by others individually or
- 1584 collectively.

1585 These personal or organizational interests can be used to describe four func-  
 1586 tional component categories that together make up the broad tactical and strate-  
 1587 gic efforts that an ISAO can perform:

- 1588 • Threat landscape awareness
- 1589 • Response measures
- 1590 • Coordination
- 1591 • Trend and pattern analysis.

1592 These broad categories, as shown below, can be further decomposed to more  
 1593 specific functional elements and information sharing capabilities to support the  
 1594 personal or organizational interests of those participating in or working with an  
 1595 ISAO.

1596 Table 1 describes these categories and sub-categories and identifies information  
 1597 sharing capabilities that support them.

1598 *Table 1. Functional Categories and Information Sharing Capabilities*

Functional Category or Sub-category	Description	Information Sharing Capability
<b>Threat landscape awareness</b>	Know what’s going on related to cybersecurity or other issues of interest to the ISAO.	
◆ Collect information: — General.	◆ Obtain threat, vulnerability, and incident information from ISAO participants and other sources for information of interest.	<ul style="list-style-type: none"> <li>◆ Anonymous and attributable submissions</li> <li>◆ Email and listservs</li> <li>◆ Calls</li> <li>◆ Meetings</li> <li>◆ Secure portal submissions</li> <li>◆ Automation feeds</li> <li>◆ Direct cybersecurity partner feeds</li> <li>◆ Traffic Light Protocol (TLP) labelling implementation</li> </ul>
◆ Focus on community of interest.	◆ As necessary, encourage community of interest participation to build deeper trust relationships.	◆ Similar capabilities as above that can be segregated and tailored for community of interest participants
— Make appropriate information available.	◆ Distribute or make information available in accordance with TLP procedures and labelling.	◆ Distribution through appropriate communication channels (portal access, email, automation platforms, etc.)

Functional Category or Sub-category	Description	Information Sharing Capability
<ul style="list-style-type: none"> <li>— Analyze collected information.</li> </ul>	<ul style="list-style-type: none"> <li>◆ Review, de-conflict, validate, sanitize, and analyze collected information.</li> <li>◆ Conduct research or intelligence to alert the members of evolving or existing threats, incidents, and vulnerabilities.</li> </ul>	<ul style="list-style-type: none"> <li>◆ Analysts and analysts' tools</li> </ul>
<ul style="list-style-type: none"> <li>— Develop alerts.</li> </ul>	<ul style="list-style-type: none"> <li>◆ Identify changes in situational awareness that may be of interest to ISAO participants and others.</li> </ul>	<ul style="list-style-type: none"> <li>◆ Communication mechanisms for levels of alert criticality</li> <li>◆ Multiple mechanisms for highest level of alerts</li> </ul>
<b>Response measures</b>	Establish operational or procedural measures to mitigate the utility or deny the effectiveness of vulnerabilities or exploits to infrastructure, operations, or systems.	
<ul style="list-style-type: none"> <li>◆ Distribute alerts and rapid notification..</li> </ul>	<ul style="list-style-type: none"> <li>◆ Provide developed alerts and notifications to appropriate participants or partners.</li> </ul>	<ul style="list-style-type: none"> <li>◆ Communication mechanisms for levels of alert criticality</li> <li>◆ Multiple and diverse mechanisms for highest level of alerts</li> </ul>
<ul style="list-style-type: none"> <li>◆ Develop countermeasures:               <ul style="list-style-type: none"> <li>— Immediate</li> <li>— Long-term.</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>◆ Develop in collaboration with participants and partners, countermeasures to mitigate risks of new threats or vulnerabilities.</li> <li>◆ Focus on immediate and then longer term measures.</li> </ul>	<ul style="list-style-type: none"> <li>◆ Conferencing and networking collaboration mechanisms for both technical experts and participants</li> <li>◆ Access to capabilities that provide searchable topic analysis for participants</li> </ul>
<ul style="list-style-type: none"> <li>◆ Identify “best” and “good” practice recommendations.</li> </ul>	<ul style="list-style-type: none"> <li>◆ Based on interests of participants, make recommendations for “best” and “good” practices to mitigate and respond to cybersecurity and other relevant risks and incidents.</li> </ul>	<ul style="list-style-type: none"> <li>◆ Conferencing, networking, and forums for collaboration among technical experts and participants</li> <li>◆ Surveying capabilities</li> <li>◆ Publishing and providing references and a repository for availability of recommendations to participants</li> <li>◆ Access to capabilities that provide searchable topic analysis for participants</li> </ul>
<ul style="list-style-type: none"> <li>◆ Determine effectiveness.</li> </ul>	<ul style="list-style-type: none"> <li>◆ Develop metrics and perform surveys to continually measure the effectiveness and satisfaction of participants with the services being provided.</li> </ul>	<ul style="list-style-type: none"> <li>◆ Participant survey capabilities</li> </ul>
<b>Coordination</b>	Synchronize and integrate activities to ensure the pursuit of the shared objectives established by the ISAO.	
<ul style="list-style-type: none"> <li>◆ Establish coordination processes and capabilities</li> </ul>	<ul style="list-style-type: none"> <li>◆ Policy and procedures established for assessing the need for coordination among members with shared interests to discuss and coordinated</li> </ul>	<ul style="list-style-type: none"> <li>◆ Communication/network mechanism for a leadership group (identified sub-group) to make a decision to activate coordination.</li> </ul>
<ul style="list-style-type: none"> <li>◆ Activate coordination</li> </ul>	<ul style="list-style-type: none"> <li>◆ Issue notification for an “emergency” call for coordination.</li> </ul>	<ul style="list-style-type: none"> <li>◆ Established diverse communication capability to initiate an “Emergency Call”</li> </ul>

Functional Category or Sub-category	Description	Information Sharing Capability
<ul style="list-style-type: none"> <li>◆ Establish coordination actions/efforts</li> </ul>	<ul style="list-style-type: none"> <li>◆ Establish “playbooks” for various situations where coordination among participants is required.</li> </ul>	<ul style="list-style-type: none"> <li>◆ For ongoing incidents of specified severity implement conferencing capabilities to determine the status, countermeasures, and response information related to an ongoing situation.</li> </ul>
<ul style="list-style-type: none"> <li>◆ Assess coordination efforts</li> </ul>	<ul style="list-style-type: none"> <li>◆ During and following coordination events continually assess decisions and actions taken.</li> </ul>	<ul style="list-style-type: none"> <li>◆ Survey capabilities.</li> <li>◆ Conferencing capabilities</li> </ul>
<p><b>Trend and Pattern Analysis</b></p>	<p>Collect information and attempt to spot a pattern or trend derived from the information of interest to the ISAO participants.</p>	
<ul style="list-style-type: none"> <li>◆ Retain historical information.</li> </ul>	<ul style="list-style-type: none"> <li>◆ Maintain history of submissions, analysis and decisions in a secure database.</li> </ul>	<ul style="list-style-type: none"> <li>◆ Secure operational database and software with appropriate access controls to segregate and deal with various sensitivity of information</li> </ul>
<ul style="list-style-type: none"> <li>◆ Perform strategic analysis:               <ul style="list-style-type: none"> <li>— Identify trends, discontinuities, or patterns of activity.</li> <li>— Determine threat actors and motivations.</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>◆ Analyze the ISAO historical information along with other information to provide value-added insights on trends and new activity of significant to the interest of participants.</li> </ul>	<ul style="list-style-type: none"> <li>◆ Analysts and analysts’ tools</li> <li>◆ External collaboration mechanisms for analysts to engage other experts</li> </ul>
<ul style="list-style-type: none"> <li>◆ Publish analysis and recommendations.</li> </ul>	<ul style="list-style-type: none"> <li>◆ Regularly communicate with ISAO participants and others based on ISAO policy and procedures.</li> </ul>	<ul style="list-style-type: none"> <li>◆ Communication channels and networking events for members to receive analysis</li> <li>◆ Access to capabilities that provide searchable topic analysis for participants</li> </ul>

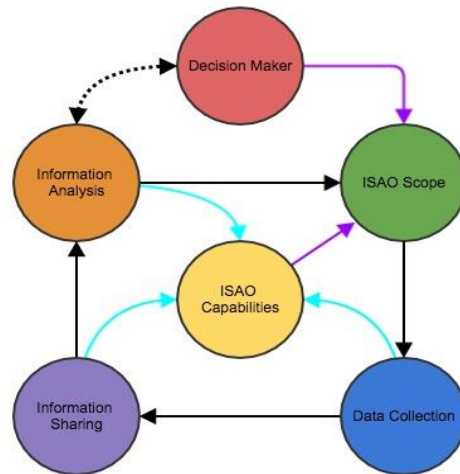

1599

1600 **6.4.1 INFORMATION ANALYSIS**

1601 Successful information sharing and analysis depends on the production of action-  
 1602 able intelligence and the likelihood that threat information will be in one place and  
 1603 accessible to participating analysts. The purpose of information analysis is to  
 1604 learn and understand data, use its context with other data to produce information  
 1605 that encourages action to improve systems, people and corporations. Information  
 1606 sharing and information analysis interdependence combined with data collection  
 1607 and an ISAO’s scope and capabilities creates the framework for delivering intelli-  
 1608 gence to decision makers as shown in the figure below.  
 1609

1610 The act of information analysis involves  
 1611 reviewing data for signs or indications of  
 1612 malicious activity. The findings from the  
 1613 review can identify artifacts or evidence  
 1614 that analysts use to link with similar threat  
 1615 data to define threat groups or cam-  
 1616 paigns. Information Sharing and Analysis  
 1617 Organizations work to bring together data  
 1618 from multiple sources to engage the ex-  
 1619 pertise of its participants for producing  
 1620 actionable intelligence. This section de-  
 1621 scribes information analysis and the ap-  
 1622 plication of information analysis.

Figure 4 Framework for delivering intelligence

1623 Information analysis involves operational  
 1624 learning and this section deconstructs  
 1625 into this into two stages. The first stage is  
 1626 the initial review of shared data. For example, an ISAO may offer their expert an-  
 1627 alysts to assess shared data to identify related threats. In the second stage, ana-  
 1628 alysts interpret relevant threat data to produce threat group, campaign summaries,  
 1629 or business risk assessments. The ISAO could include a service to use their  
 1630 knowledge and experience to improve the coherence and relevance of the threat  
 1631 data to produce reports for decision makers to improve network security or adjust  
 1632 IT security roadmaps.

1633 Information analysis has inherent challenges. First among them is identifying rel-  
 1634 elevant data amongst streams of data feeds and data lakes. ISAO members may  
 1635 need assistance with data comprehension, its relevance to other data, and its co-  
 1636 herence to similar data. The application of information analysis with the use inter-  
 1637 pretation models may address these challenges. A list of interpretation models  
 1638 and examples is shown below. The list is separated into two sections: first and  
 1639 second stage. The first stage applies to finding relevant threat data and the sec-  
 1640 ond stage shares examples of how to improve data context.

- 1641 • First Stage
- 1642     ▪ Order Estimation is the estimate of a variable whose precise value is
- 1643         unknown. For example, a malware reverse engineer may develop cal-  
 1644         culations (the estimate) to triage a large binary data set to identify a  
 1645         subset of binaries with possible malicious code (the unknown).
- 1646     ▪ False positives and false negatives are concepts in statistical testing.
- 1647         False positives and false negatives in information analysis often relates  
 1648         to host and network based signatures and the quality of detection. A  
 1649         false positive indicates threat detection when actually there was no  
 1650         threat. A false negative may occur when a threat scan failed while it  
 1651         was successful.

- 1653
- 1654
- 1655
- 1656
- 1657
- 1658
- 1659
- 1660
- 1661
- 1662
- 1663
- 1664
- 1665
- 1666
- 1667
- 1668
- 1669
- 1670
- 1671
- 1672
- Second Stage
    - Second-order and higher-order logic—This logic reasons that a set of relevant threat data can be identified with properties that also define each data point. For example, analysts could take indicators of compromise and develop parameters to create sets of indicators of compromise to describe a campaign, threat activity, or threat groups.
    - Confidence Interval—Analyst may use estimations based on their observations to describe confidence within unknown data sets. Level of confidence is subjective and set by the analyst. The analyst’s assessment should be complimented with the data significance. Significance may be based on the parameters defined by second-order logic.
    - Bayes’ Theorem—“Describes the probability of an event, based on conditions that might be related to the event. For example, suppose a threat researcher is interested in whether a threat actor uses a specific command and control binary, and knows the threat actor’s spear phishing tactic. If the binary is related to the spear phishing tactic, then, using Bayes’ theorem, information about the spear phishing tactic can be used to more accurately assess the probability that the threat actor used the command and control binary.”

1673 The above models aid analysts in their effort to explain their assessment of threat  
1674 information. For example, a threat group may refer to actors who work together  
1675 to target and penetrate networks of interest. These individuals may share the  
1676 same set of tasks, coordinate targets, and share tools. They work together to  
1677 gain access to their targets and steal data. A group is defined by its actors and  
1678 not solely by methodology. Distinguishing one threat group from another is possi-  
1679 ble with enough information and analytical experience.

1680 Analysts ultimately communicate their assessments to decision makers. Com-  
1681 mon communication report types are alerts, notifications or assessments. ISAOs  
1682 may need to survey their members to determine the content format that works  
1683 best for its decision makers. The following list suggests content for information  
1684 analysis reporting:

- 1685
- 1686
- 1687
- 1688
- 1689
- Impact of threats to core corporate functions
  - Describe threat activity relative to an attack life cycle
  - Pro-active (assessments) and reactive reporting (post-mortem to an inci-  
dent)

1690 An ISAO offering information analysis services should be capable of storing data  
1691 from varied data sources (both privileged and public) and experienced in data re-  
1692 view, threat interpretation, and development of intelligence assessments.

**1693 6.4.2 TREND AND PATTERN ANALYSIS**

1694 After determining the collected data points, how data will be accessed and se-  
1695 curely stored the ISAO can consider their analytic approach and the types of re-  
1696 ports available to their members. ISAO members may have different appetites for  
1697 intelligence consumption. For example, an ISAO focused on security or network  
1698 operations may desire information that filters relevant data from network noise.  
1699 Another ISAO may choose to engage on comparable threat activity. An ISAO  
1700 should consider a survey of their members to understand what type of reporting  
1701 is most useful and what each member is willing to contribute to the aggregate  
1702 collection.

1703 Analysis involves interpretation and learning based on all available data sources.  
1704 The analytical options for an ISAO includes detection of first-seen or anomalous  
1705 activity, identification of an exploit to a software or network vulnerability, collect-  
1706 ing of related threat activity, or attribution to an individual, criminal enterprise, or  
1707 nation-state. ISAOs considering analytical services could consider data stores to  
1708 enable trend and pattern analysis and facilitate member communication about  
1709 threats. For example, a threat knowledge base consisting of indicators for detec-  
1710 tion, threat information for response, and attribution for risk management. This  
1711 threat knowledge base enables the ISAO and its participants to use analytic  
1712 methods and share their knowledge and assessments.

1713 Analyst assessment help to better understand relevant threat information how-  
1714 ever the analyst's environment or visibility may introduce bias when categorizing  
1715 threat or attributing threat activity to an actor. A threat intelligence sharing com-  
1716 munity creates a culture that reduces analyst bias and provides continuous feed-  
1717 back through detection, peer communication, and external confirmation.

1718 Prior to doing analysis, ISAOs may want to begin by helping their members take  
1719 data quality measurements. The validity of trend and pattern analysis relies on  
1720 accurate and relevant inputs.

1721 While all members must agree on what to share, a number of common reports  
1722 have been useful in the past, which they might want to create:

- 1723 • Pivot reports—Observed IP addresses that show connecting hop points.  
1724 Members can utilize these reports to identify areas of common concern.
- 1725 • Malware—An ISAO could collect the hash values of malware that the mem-  
1726 bers see on their networks each month.
- 1727 • Campaigns—ISAO members may want to share information on a given cam-  
1728 paign, such as ransomware or business email compromise. They can share  
1729 observed TTPs used by the actors.

1730 Anonymous member surveys may be a reporting method ISAOs may want to uti-  
1731 lize to do trends. A collaborative tool can be used to collect aggregated metrics  
1732 from companies on a monthly basis that cover observables such as number of

1733 phishing attempts, intrusion attempts, successful intrusions, intrusions with data  
1734 theft, accounts compromised, distributed denial of service attacks, etc. The ISAO  
1735 can then create a trend report for its members which can use attributes about  
1736 members without specifying the member name. For example, the ISAO weekly or  
1737 monthly report could identify attack types by size of the business, the sector, time  
1738 of day the activity occurred during, the IP and the country of origin of the attacker  
1739 (if known), vector used, etc.

1740 If member companies agree, an ISAO may want to utilize sensors on member  
1741 networks that look at IDS logs and report attributes back to a secure shared data-  
1742 base managed by the ISAOs, to which all members have access for generating  
1743 reports and alerts.

1744 ISAOs should also consider using a common vocabulary for reporting cyber ac-  
1745 tivity, which can be aggregated across ISAOs and, if they choose, with govern-  
1746 ment agencies. [STIX](#) is an example of a commonly used structured expression  
1747 for tracking cyber activity. A number of companies and information sharing ana-  
1748 lytic centers utilize STIX and TAXII servers for information exchange and report-  
1749 ing. The Industrial Control Systems ISAC ([ICS-ISAC](#)) is one such example.  
1750 Examples of reporting using STIX can be found on [Github](#).

1751 As ISAOs mature and aggregate data, they can look at creating baselines of nor-  
1752 mal behavior and doing predictive analytics that will identify anomalies and indi-  
1753 cators of future actions.

### 1754 **6.4.3 APPLYING SHARED INFORMATION**

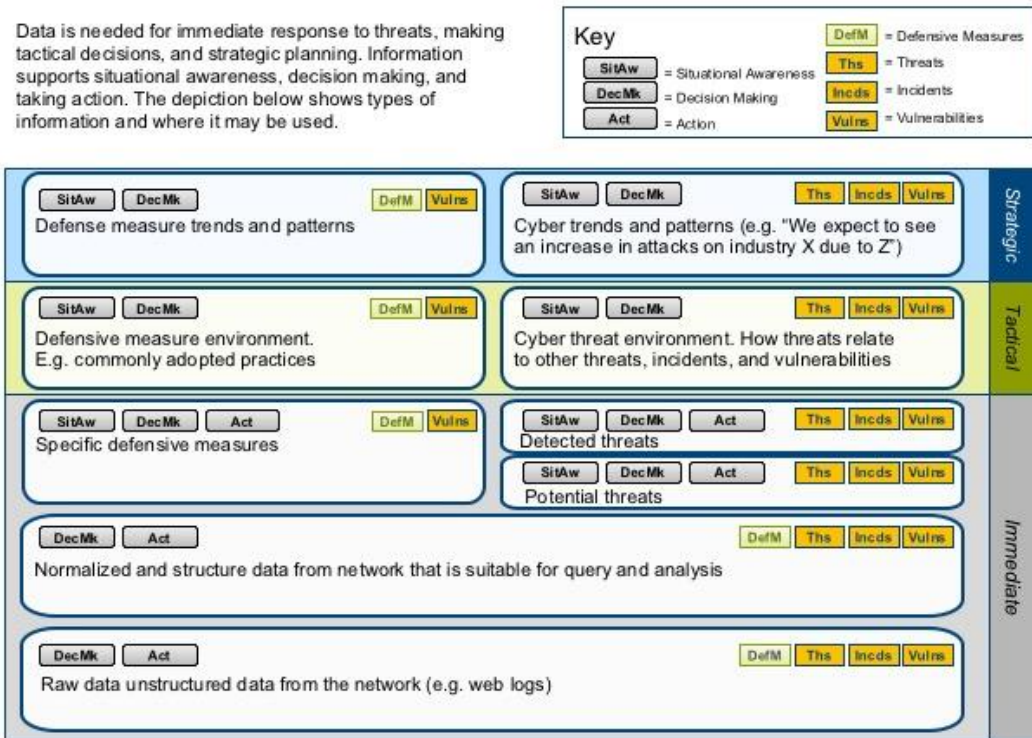

1755 Specific types of information—namely, regarding threats, vulnerabilities, and inci-  
1756 dents—can support the framework and an organization’s efforts to manage and  
1757 mitigate its cybersecurity-related risks.

1758 Figure 5 depicts at a high level where specific types of information can be used.  
1759 The depiction seeks to show the hierarchy of information and how progressive  
1760 levels of analysis can turn raw, unstructured data into valuable knowledge of the  
1761 environment. Armed with this knowledge, organizations can then prioritize efforts  
1762 to defend against the most prevalent threats. As discussed previously, the cate-  
1763 gories of information are:

- 1764 • **Immediate**—Information needs that concern actions to defend against or re-  
1765 spond to new threats, vulnerabilities, or incidents.
- 1766 • **Tactical**—Information needs that concern decisions on how to best deploy an  
1767 organization’s existing resources against the change in situational awareness.
- 1768 • **Strategic**—Information needs that concern making plans and decisions on  
1769 the efforts and resources needed to address emerging or future threat envi-  
1770 ronments.

1771

Figure 5. Applying Information to Cybersecurity Risks

1772

## 7 ARCHITECTURAL CONSIDERATIONS

1773 People share information in many ways, but there is a tendency toward a few  
 1774 basic models commonly used among ISAOs. This section details two common  
 1775 sharing models that ISAOs may consider adopting. They are driven primarily by  
 1776 the role of an information "authority" and can be blended into hybrid approaches.  
 1777 This section also details several methods that can be applied to either of the  
 1778 models. Sharing methods are largely directed by community requirements and  
 1779 concepts of operations, and are also tied to how the tools and technology  
 1780 adopted by an ISAO enable certain kinds of sharing. Finally, this section intro-  
 1781 duces some popular sharing mechanisms that can be considered for adoption  
 1782 when establishing or further developing an ISAO.  
 1783

1784 These are nothing more than concepts and practices that have been used suc-  
 1785 cessfully by ISAOs, and that may serve as guidance for a community interested  
 1786 in forming a new ISAO. Ultimately, how models, methods, and mechanisms are  
 1787 implemented will vary widely based upon ISAO member needs, administrator ca-  
 1788 pabilities, community goals, available technology, and the centers and dynamics  
 1789 of trust in a community. ISAOs are encouraged to consider what models and  
 1790 mechanisms could be a good fit for the context in which each operates, but they  
 1791 are equally encouraged to refine, adapt, and expand them to best meet the  
 1792 ISAO's needs.

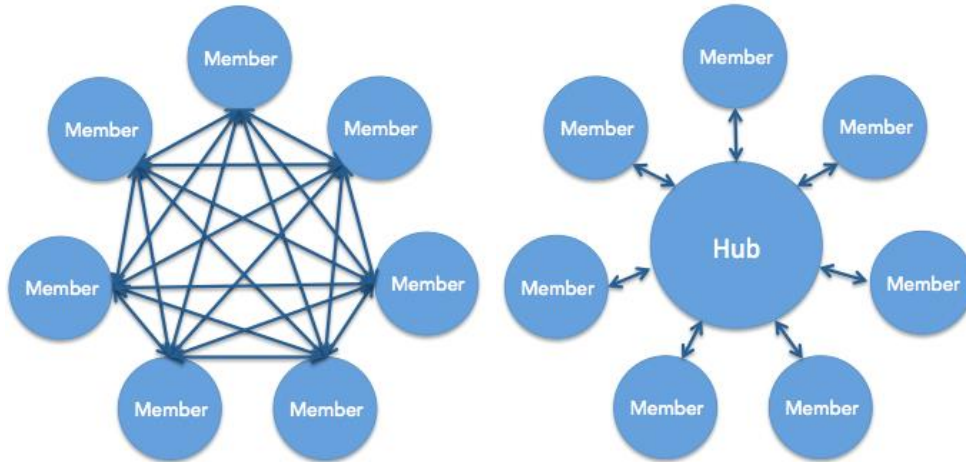

1793 **7.1 GENERALIZED ARCHITECTURES**

1794 Peer-to-peer and hub-and-spoke sharing models may be the most useful basic  
 1795 arrangements that new ISAOs may consider when getting established.

1796 **Peer-to-Peer**

**Hub-and-Spoke**

1797

1798

1799

1800 **7.1.1 PEER-TO-PEER**

1801 The peer-to-peer sharing model is defined generally by the ability of any member  
 1802 of a community to interact and share with any other member. Peer-to-peer net-  
 1803 works can be especially beneficial for smaller communities or when members  
 1804 only interact with a part of a community. They may also be especially beneficial  
 1805 for those whose members have asymmetrical trust relationships or share under  
 1806 highly dynamic conditions that often change based upon content, current threat,  
 1807 etc. Members generally have a high degree of choice when determining with  
 1808 whom they share in the community. In this model, there is no “gatekeeper” gov-  
 1809 erning event-by-event sharing, and how and what sharing occurs. That is not to  
 1810 say that an authority (ISAO administration, for example) does not create or en-  
 1811 force a sharing policy, or perform other authoritative duties. Instead, members of  
 1812 the community generally share when, what, and with whom they see fit, based  
 1813 upon established ISAO policy and procedures and within the confines of the tools  
 1814 used.

1815 A challenge with this model is the potential difficulty managing many trust rela-  
 1816 tionships when community membership grows. In addition, redundant sharing of  
 1817 the same information may be more likely in this model, and may lead to ineffi-  
 1818 cient “churn” depending upon ISAO technology and other conditions.

### 1819 **7.1.2 HUB AND SPOKE**

1820 Generally, the hub-and-spoke sharing model incorporates a “gatekeeper” at the  
1821 center, or hub, of the community. Members share through the hub while some  
1822 combination of people, process, and technology drive redistribution out to the  
1823 rest of the community. This sharing model provides opportunities to centralize,  
1824 formalize, or otherwise influence information exchange for the benefit of the com-  
1825 munity. This may take the form of ISAO administration funneling and vetting  
1826 widely disparate member and vendor threat intelligence, offloading threat analy-  
1827 sis services from the membership to achieve economies of scale, enforcing pol-  
1828 icy, or simply playing a more central and visible role in the day-to-day activities of  
1829 the ISAO. In addition, the hub is a logical place for a single “ground truth” to exist  
1830 for the community, whether that has to do with policies and procedure, a current  
1831 or official take on recent incidents or campaigns, or other areas relevant to the  
1832 ISAO.

1833 There are a few challenges to consider with this model. Dependency on the hub  
1834 could lead to problems if the hub is not performing as strongly as it should. A  
1835 high degree of trust should exist in the people, process, and technology at the  
1836 hub in order for this sharing model to succeed. And regardless of the level of  
1837 trust in the hub, members will always have varying degrees of trust relationships  
1838 elsewhere among ISAO membership. Always funneling threat data or cyber  
1839 (common) threat Indicators (CTIs) through the hub could inhibit the growth of per-  
1840 sonal relationships among ISAO members. Relationship building will lead to trust  
1841 among the membership, and trust is arguably the primary key performance indi-  
1842 cator for successful threat intelligence sharing.

### 1843 **7.1.3 HYBRID APPROACH**

1844 An ISAO can address some of the challenges of the peer-to-peer and hub-and-  
1845 spoke models by forming a hybrid approach that combines elements of both.  
1846 This could take virtually limitless forms, but the following are some possibilities:

- 1847 • Channel some kinds of threat intelligence through the hub for redistribution,  
1848 based upon hub strengths and core competencies. Budget, people, technol-  
1849 ogy, or geography, and how these factors articulate with member require-  
1850 ments and objectives could all help determine what obligations and tasks are  
1851 a good fit for the hub.
- 1852 • Leverage peer-to-peer sharing for certain kinds of intelligence, such as strate-  
1853 gic intelligence. Peers working together to build a threat actor profile, for ex-  
1854 ample, is a great way to leverage community resources, build relationships  
1855 and trust among ISAO membership, and make a positive contribution back to  
1856 the ISAO community. And the work product could be re-distributed through  
1857 the ISAO hub, combining aspects of both peer-to-peer and hub-and-spoke  
1858 models.

1859 These sharing models are high-level conceptualizations of how an ISAO can  
1860 share information. When a newly forming ISAO has a good sense of what it

1861 wants to do, the kinds of sharing methods and mechanisms that it employs will  
1862 be paramount to getting things done.

## 1863 **7.2 SHARING METHODS**

### 1864 **7.2.1 PUBLISH–SUBSCRIBE**

1865 A publish-subscribe method for sharing threat intelligence consists of a producer  
1866 who publishes information on a regular or irregular basis, and whose publications  
1867 are individually subscribed to by one or more community members. This ap-  
1868 proach can be applied in either the peer-to-peer or the hub-and-spoke sharing  
1869 models. In the case of a peer-to-peer network, a producer could, for example, au-  
1870 tomate CTI sharing into a repository from which other members pull feeds, or a  
1871 producer can post to a message board/forum and subscribers can receive alerts.  
1872 In the case of the hub-and-spoke model, the publisher may be the ISAO hub and  
1873 the producers (members) could submit to the hub for processing—usually to ver-  
1874 ify, refine, de-dupe, or correlate with other known threat intelligence—before pub-  
1875 lishing it out to the ISAO subscriber base. The precise role of the hub can vary  
1876 widely, depending upon ISAO CONOPS and other conditions. One of the bene-  
1877 fits of the publish-subscribe method in a hub-and-spoke model is the ability for  
1878 the ISAO to communicate a “ground truth” on an issue, incident, or actor—some-  
1879 thing very useful when many passionate voices are saying slightly different things  
1880 in a rapidly evolving environment, which may create misunderstanding or confu-  
1881 sion.

### 1882 **7.2.2 CROWDSOURCING**

1883 Crowdsourcing for threat intelligence says as much about the generation of CTI  
1884 as how it is shared. ISAO members collectively contribute to a discussion thread,  
1885 an automated threat sharing repository, or other system to organically transform  
1886 granular threat data into more coherent threat intelligence. By virtue of participat-  
1887 ing in crowdsourcing the intelligence picture, the information is also shared with  
1888 members. Like the publish-subscribe method above, crowdsourcing can take  
1889 place in both peer-to-peer and hub-and-spoke networks—the key distinction be-  
1890 ing the presence of a central party directing the crowdsourcing through the hub,  
1891 versus true organic freewheeling among the community. Both, of course, can be  
1892 very effective. One of the benefits of crowdsourcing is that the virtual social inter-  
1893 actions among ISAO members help to build trust and community.

1894 These are two common sharing methods that are closely tied to the tools and  
1895 technology an ISAO uses to support its CONOPS. New ISAOs can seek certain  
1896 tools to enable sharing methods that it already believes will be effective. Alterna-  
1897 tively, the tools it already uses may determine what sharing methods are at its  
1898 disposal.

**1899 7.3 SHARING MECHANISMS**

1900 A variety of mechanisms and practices can be used to share information among  
1901 an ISAO's members and partners. The table presented in this section can pro-  
1902 vide guidance for new or existing ISAOs considering initial or additional mecha-  
1903 nisms and practices. The mechanisms and practices selected will need to be  
1904 tailored to the scope, timeliness, and sensitivity of the information to be shared.

1905 Information sharing can occur one-to-one, one-to-many, many-to-many, and  
1906 many-to-one. As a result, practices an ISAO selects for communication and shar-  
1907 ing information must reflect the overall objectives an ISAO is seeking to achieve  
1908 for its members.

1909 Due to the sensitivity of some information, methods and mechanisms use to  
1910 share information must be capable, in accordance with an ISAO's policies or  
1911 other authoritative restrictions, to protect and provide information to authorized  
1912 members. ISAO that use a Traffic Light Protocol (TLP) to handle and distribute  
1913 sensitive information will need to use mechanisms that have capabilities to com-  
1914 ply with their TLP policy.

1915 If anonymity of sources of information is required, additional information sharing  
1916 processes, procedures, and features will be required. For that reason, the prac-  
1917 tices selected by an ISAO and its operational procedures will need to provide the  
1918 operational, security, and management features necessary to meet the ISAO  
1919 members' objectives.

1920 Information sharing mechanisms should also be selected with consideration for  
1921 the importance, timeliness, and criticality of receipt of information by ISAO partici-  
1922 pants. Members should be able to authenticate and trust that the information  
1923 comes from expected sources. In some cases, positive confirmation of receipt of  
1924 information may be required to ensure delivery of time-sensitive information.

1925 Effective ways of sharing information among ISAOs can include, based on mem-  
1926 ber and customer needs, the following:

- 1927 • Automated (primary indicator and defensive measures, then follow-on infor-  
1928 mation)
- 1929 • Direct feeds from threat intelligence firms
- 1930 • Automated information sharing platforms
- 1931 • Chat and social media platforms.

1932 Table 2 below lists a number of mechanisms to consider.

1933

Table 2. Sharing Mechanisms To Consider

The mechanisms listed below provide general guidance on various options and their applicability:								
Description		Applicable To (* Note)				Can provide Anonymity	Access control features	Comment
		one to one	one to many	many to many	many to one			
In persons meetings	Individuals physically meet with participation restricted to authorized individuals.		X	X		No	One Level: All authorized receive the information.	Access control to information can be restricted to a selected participating community through procedures.
Tele-conferencing/WebEx, etc.	Commercial conferencing and collaboration services		X	X		No/Yes	One Level: All authorized receive the information.	A central management function required to achieve anonymity but in general not anonymous. Access control to information can be restricted to a selected participating community through procedures.
Email (general)	Internet-based email	X	X	X	X	No/Yes	Distribution can be restricted	A central management function required to achieve anonymity but in general not anonymous. Distribution restrictions possible but difficult to manage for a large number of participants.
Email (with encrypted message)	Encrypted file or message	X	X			No/Yes	Access to information based on	Use of end-to-end encryption mechanisms, e.g. SMIME, PGP, etc.
Email - Listservers	Services for managing email lists		X	X		No/Yes	Distribution can be restricted	A central management function required to achieve anonymity but in general not anonymous.
Messaging Services (Short, Enhanced and Multi-media)	Carrier and vendor based services	X	X			No	Distribution can be restricted	Examples, Slack, HipChat, etc. Challenge-reply authentication can prevent spoofing.
Peer-to-Peer Networks	Characterized as a server-less network.			X		No	Distribution can be restricted	Security policies should be implemented to define what types of P2P software is acceptable and what information can be shared through them due to various risks.

1934

1935

1936

Description		Applicable To (* Note)				Can provide Anonymity	Access control features	Comment
		one to one	one to many	many to many	many to one			
Website (Public)	All pages available at the sites URL		X			No/Yes	No restrictions	Central management trusted to be responsible for assuring posted information is anonymous.
Website (Private)	Selected pages at website require access credentials		X			No/Yes	One Level: Those with website access credential	Central management trusted to be responsible for assuring posted information is anonymous.
Secure Portal	Electronic gateway to a collection of digital files, services, and information, accessible over the Internet through a web browser. A client-server based system with multi-levels of access control to searchable databases.		X	X	X	No/Yes	Multi-levels of access control based on authorized access policies and authorized credentials.	Central management enforces authorization and rules-based access control policies. Anonymity achieved through an anonymous access credential distribution process and posting/review by portal management policies and procedures.
Automated Mechanisms	Structured representations of cyber threat information automatically shared among trusted partners and communities in a machine processing structure.	X	X	X	X	Yes	Multi-levels of access control based on authorized access policies and authorized credentials.	An example is STIX™ (Structured Threat Information eXpression) language < <a href="https://www.mitre.org/sites/default/files/publications/stix.pdf">https://www.mitre.org/sites/default/files/publications/stix.pdf</a> >
Notification Services	Notification Services generate and send messages to users or other applications that have subscribed to the service.	X	X			No	Multi-levels of access control based on authorized access policies and authorized credentials.	Notifications may be by e-mail, telephone, fax, text messages, etc.
* Note:	One-to-One	One sender and One Receiver						
	One-to-Many	One Sender and Many Receivers						
	Many-to-One	Many Senders and One Receiver						
	Many-to-Many	Many Senders and Many Receivers						

1937

1938

1976

The trusted relationships essential to an effective ISAO must embrace a culture of operational security among its members, partners, and those with whom they share information. This culture is enabled through well designed ISAO operational policies, procedures, awareness, and good practices.

An ISAO's operational security efforts should include the following considerations:

- Establishing the criteria and vetting process for those eligible to participate in the ISAO.
- Examining the full range of the sensitive information an ISAO will be handling and communicating, and then using a risk-based assessment to develop the ISAO's operating rules,<sup>8</sup> information policies, and controls to be implemented across the ISAO and for members when interacting with the ISAO.
- Defining policies that address any identification of membership, the ownership of the information shared with the ISAO, the use of the information shared, the sharing of information among members and with others, along with any analytic product developed by the ISAO. To implement these policies, the agreed upon controls and practices to be exercised by members shall be documented and be a condition for participation in the ISAO.
- Specifying how information is to be provided the ISAO and members along with any review processes that may be implemented to protect the confidentiality and privacy of the content.
- Since information often has value when it is shared in a timely manner, establishing procedures for expediting and prioritizing information to be shared.
- Defining the labelling and handling procedures for the range of sensitive information to be handled within the ISAO and among members. Implementing the Traffic Light Protocol<sup>9</sup> approach used by ISACs and others for these purposes should be considered.
- Specifying procedures and practices where anonymity of information sources will enhance the sharing and trust among members and maintaining them in the operations of the ISAO. In practice there will be times when the owner of the information can decide that anonymity is not necessary or practical, and procedures should accommodate an information owner's prerogative.
- The responsible leadership/management of an ISAO shall ensure there is an active and periodic awareness effort to keep members informed of the expected code of conduct and their responsibilities in accordance with the ISAO's policies, procedures, and practices for the sharing and interactions

---

<sup>8</sup> As an example, the "Operating Rules" of the FS-ISAC are available at [https://www.fsisac.com/sites/default/files/FS-ISAC\\_OperatingRules\\_2015.pdf](https://www.fsisac.com/sites/default/files/FS-ISAC_OperatingRules_2015.pdf)

<sup>9</sup> <https://www.us-cert.gov/tlp>

- 1977 among and with members. Any changes made should be fully vetted with and
- 1978 promulgated to participants.
- 1979 • Developing specific operating rules for automation capabilities for real-time or
- 1980 near-real time information sharing, if used by the ISAO, because of the critical
- 1981 impacts (both positive and negative) such capabilities can have on an ISAO
- 1982 or those participating in the automated sharing of information.
- 1983 • Establishing procedures and criteria for removing members who violate the
- 1984 trust and agreements of the ISAO; ensuring that organizations which assign
- 1985 personnel to be a member of an ISAO notify the ISAO of any changes in their
- 1986 assigned personnel status; ensuring that access authorizations are periodi-
- 1987 cally reviewed and procedures are in place for removing access authoriza-
- 1988 tions that are no longer valid.
- 1989 • For ISAOs directly employing active measures against those attempting to
- 1990 compromise or exploit systems, establishing and thoroughly examining their
- 1991 operations security measures to avoid tipping off exploiters.
- 1992 These operational considerations only highlight general aspects that ISAOs
- 1993 should establish, and their specific operational security policies and procedures
- 1994 must address their specific operations and the sensitivity of information being
- 1995 handled. ISAO operations will change over time, and periodic review of opera-
- 1996 tional security procedures and policies may require updates. Annual reviews can
- 1997 be an effective check to ensure that they are up to date.

## 9 INFORMATION PRIVACY

- 1998 It is important for ISAOs that receive, analyze, retain, use, or disseminate cyber
- 1999 threat indicators or other information through a voluntary cybersecurity infor-
- 2000 mation sharing process to be sensitive to and protective of privacy considera-
- 2001 tions. This includes the privacy of the individual members of an organization, any
- 2002 individuals concerning whom data may be available or provided, and a full range
- 2003 of other constituencies, customers, and individuals. To protect privacy while ac-
- 2004 complishing the goals of an ISAO, it is important for the ISAO to provide guid-
- 2005 ance to members, participants, and ISAO staff on how to balance the goals of
- 2006 sharing information with protecting privacy. The purpose of this section is to help
- 2007 ISAOs attain that balance.
- 2008
- 2009 Before sharing cyber threat indicators, the privacy implications of what is being
- 2010 shared must be considered, including:
- 2011 • whether information not directly related to cybersecurity threats or the pur-
- 2012 poses for which the information may be shared is included;
- 2013 • whether information is included that the ISAO knows to be personal infor-
- 2014 mation about a specific individual or that identifies a specific individual; and
- 2015 • whether the ISAO staff or members have made efforts to identify and assess
- 2016 any such information.

2017 Given the nature of a cyber threat indicator, oftentimes an individual whose per-  
2018 sonal information is directly related to a cybersecurity threat does not have the  
2019 opportunity to consent to involvement in the process used to collect that infor-  
2020 mation, or access or correct that information. ISAOs must limit the impact of the  
2021 data they collect on individual privacy.

2022 Sensitive information such as personally identifiable information (PII), intellectual  
2023 property, and trade secrets may be encountered when handling cyber threat in-  
2024 formation. The improper disclosure of such information could cause harm. Ac-  
2025 cordingly, organizations should implement the necessary security and privacy  
2026 controls and handling procedures to protect this information from unauthorized  
2027 disclosure or modification.

2028 Often data requires protection, either by law, regulation, or contractual obligation.  
2029 This includes PII and other sensitive information afforded protection under the  
2030 Sarbanes-Oxley Act, the Payment Card Industry Data Security Standard, the  
2031 Health Insurance Portability and Accountability Act (HIPAA), the Federal Infor-  
2032 mation Security Modernization Act of 2014, the Gramm-Leach-Bliley Act, and  
2033 Health Information Technology for Economic and Clinical Health (HITECH) Act,  
2034 among others. It is important for ISAOs to identify and appropriately protect such  
2035 information. ISAOs should consult legal, privacy, and data experts familiar with  
2036 the various regulatory frameworks when developing procedures for identifying  
2037 and protecting sensitive information to ensure compliance with all existing privacy  
2038 regulatory and legal requirements at the federal, state, local, and international  
2039 level.

2040 As noted above, ISAOs should limit the receipt, retention, use, and dissemination  
2041 of cyber threat indicators containing personal information about specific individu-  
2042 als or information that identifies specific individuals.

## 2043 **9.1 CORE PRINCIPLES**

- 2044 • ISAO members are encouraged to identify and contribute indicators that are criti-  
2045 cal to identifying threats, make efforts to minimize the PII shared with the ISAO or  
2046 other members, and ensure compliance with all existing privacy regulatory and  
2047 legal requirements at the federal, state, local, and international level.
- 2048 • If a member inadvertently submits PII to an ISAO, the member should under-  
2049 stand how to notify the ISAO.
- 2050 • ISAOs may want to develop policies and procedures that provide for the timely  
2051 destruction or return of cyber threat indicators containing personal information  
2052 about specific individuals or information that identifies specific individuals.
- 2053 • ISAOs are encouraged to consider providing information to members regarding  
2054 with whom they intend to share or may share information, such as whether they  
2055 may share with the government, and notice of any material changes in policy or  
2056 practice. An ISAO should also seriously consider, after obtaining any legal advice

2057 it may need, disclosing to its members whether it seeks to operate within the con-  
2058 fines of the Cybersecurity Information Sharing Act of 2015 (CISA) in order to ob-  
2059 tain liability protection and how it may do so, including the potential risks and  
2060 implications of that choice for privacy and other matters.

## 2061 **9.2 SUPPORTING PRINCIPLES**

2062 For example, DHS has issued guidance related to privacy issues when sharing  
2063 within industry. That guidance is important for attaining liability protections under  
2064 U.S. law and is referenced here and in Appendix A.<sup>10</sup> It is important that ISAOs  
2065 and their participants and member organizations are familiar with applicable pri-  
2066 vacy law and policy and incorporate appropriate commitments and policy provi-  
2067 sions into member rules, foundational documents, and user agreements.

2068 ISAOs may want to consider designating responsibility and authority to a staff  
2069 member, board member, or outside party (such as a contractor or attorney) for  
2070 ensuring compliance with applicable state and other privacy laws privacy laws  
2071 and taking action if such issues arise,

2072 Segmentation, a process for identifying certain data fields that may require spe-  
2073 cial handling of sensitive personal information, is important to ISAOs when devel-  
2074 oping cyber threat indicators. Segmentation may include a process for identifying  
2075 certain data fields that could require some review, either always or by sampling  
2076 (and the sampling could be by field, by item, a combination, or otherwise); a pro-  
2077 cedure for returning, deleting, or otherwise minimizing PII; and a way to counsel  
2078 or advise members, if any, who frequently handle PII with less than the neces-  
2079 sary care. If information to be shared is not always subjected to a privacy review  
2080 by the ISAO, it may want to consult with legal experts to identify whether there  
2081 are any implications for liability or the availability of liability protection.

2082 When sharing automated indicators with DHS, ISAOs may be required to adhere  
2083 to various practices and agreements, including the DHS Automated Information  
2084 Sharing (AIS) Terms.<sup>11</sup>

2085 Certain DHS requirements of note are included in the Terms of Use:

- 2086 • Section 3.2 states that “An AIS Producer shall use reasonable efforts to en-  
2087 sure that any Indicator or Defensive measure shared is accurate at the time  
2088 that it is supplied. Further, the AIS Producer will associate any Indicators or  
2089 Defensive Measures it produces with the appropriate Information Handling  
2090 Level as defined by the NCCIC [National Cybersecurity and Communications  
2091 Integration Center].”
- 2092 • Section 3.3 states that “Each AIS Producer will use reasonable efforts to re-  
2093 move from any Indicators or Defensive Measures provided to the NCCIC any  
2094 information not directly related to a cybersecurity threat that the AIS Producer

<sup>10</sup> <https://www.us-cert.gov/ais>

<sup>11</sup> [https://www.us-cert.gov/sites/default/files/ais\\_files/AIS\\_Terms\\_of\\_Use.pdf](https://www.us-cert.gov/sites/default/files/ais_files/AIS_Terms_of_Use.pdf)

- 2095 knows at the time of sharing to be personal information that identifies a spe-  
2096 cific individual.”
- 2097 • Section 3.4 states that “Each AIS Producer agrees that, in the event it dis-  
2098 closes Indicators or Defensive Measures by mistake, in error, or without their  
2099 appropriate Information Handling Level (through mismarking or a failure to  
2100 mark), it shall promptly notify the NCCIC and take all reasonable steps to miti-  
2101 gate, including sending a versioning update, as soon as it is able.”
- 2102 When engaging with international partners or sharing information across national  
2103 borders, ISAOs and their members should be aware that international privacy  
2104 laws may differ from U.S. federal, state, or local laws. For example, depending  
2105 on membership and circumstances, ISAOs should seek to understand what infor-  
2106 mation, if shared, might need to be compliant with U.S.-European Union (EU)  
2107 agreements like Privacy Shield, the EU General Data Protection Regulation  
2108 (GDPR), and the Network and Information Security Directive.
- 2109 If an ISAO decides to share threat indicators or defensive measures with the  
2110 NCCIC or other government partners—particularly if it intends to secure the legal  
2111 protections available under CISA—it must become familiar (with the help of legal  
2112 counsel, if needed) with the privacy guidance available from the DHS, the De-  
2113 partment of Justice, and other agencies regarding information sharing and the re-  
2114 quirements of CISA for securing liability protection. Depending on the sharing in  
2115 which it may engage, it should implement that guidance in connection with its  
2116 processes and procedures. It must do so if it is sharing with the federal govern-  
2117 ment and seeking the full scope of protections available under CISA, and may  
2118 consider doing so for sharing that is only within industry. That guidance is in-  
2119 tended to help protect privacy and to provide a path to secure such legal protec-  
2120 tion for sharing as may be available under CISA, whether sharing with the federal  
2121 government through the NCCIC or sharing only in the private sector. Liability pro-  
2122 tection under CISA may require the sharing party to conduct some privacy scrub  
2123 in accordance with the statute.
- 2124 See, for example, Guidance to Assist Non-Federal Entities to Share Cyber  
2125 Threat Indicators and Defensive Measures with Federal Entities under the Cyber-  
2126 security Information Sharing Act of 2015, including at p. 14 and Annex 1: Sharing  
2127 of Cyber Threat Indicator and Defensive Measure Sharing between Non-Govern-  
2128 mental Entities under CISA, June 15, 2016.<sup>12</sup>
- 2129 The guidance also provides examples of certain personally identifiable infor-  
2130 mation that can be part of a threat indicator and be shared, including particular IP  
2131 addresses in certain circumstances and also gives examples of personal or other  
2132 information that should not be shared and of impermissible uses of shared infor-  
2133 mation.

---

<sup>12</sup> [https://www.us-cert.gov/sites/default/files/ais\\_files/Non-Federal\\_Entity\\_Sharing\\_Guidance\\_%28Sec%20105%28a%29%29.pdf](https://www.us-cert.gov/sites/default/files/ais_files/Non-Federal_Entity_Sharing_Guidance_%28Sec%20105%28a%29%29.pdf)

- 2134 The following are additional examples of actions an ISAO may wish to consider  
2135 and address in processes and procedures developed to guide its functions:
- 2136 • Socialize the processes, procedures, plans, and exercises to make sure ISAO  
2137 managers know what to do and respond appropriately if the ISAO receives PII  
2138 that it possibly should not have received.
  - 2139 • Review various guidance on privacy considerations, such as the privacy sec-  
2140 tion in the NIST Framework for Improving Critical Infrastructure Cybersecurity  
2141 and determine which of those recommended actions are relevant to their op-  
2142 erations.
  - 2143 • Identify the safeguards necessary at all stages of the PII lifecycle within the  
2144 organization and proportionate to the sensitivity of the PII to protect against  
2145 loss, theft, unauthorized access or acquisition, disclosure, copying, use, or  
2146 modification.
  - 2147 • Identify the processes and procedures necessary to securely dispose of, de-  
2148 identify, or anonymize PII that is no longer needed.
  - 2149 • Identify the processes to ensure that access to databases containing PII is  
2150 audited. Log PII as part of an independent audit function, and determine how  
2151 such PII could be minimized while still implementing the cybersecurity activity  
2152 effectively.
  - 2153 • Evaluate the DHS profile for the AIS portal, including any privacy require-  
2154 ments.
  - 2155 • Determine whether a minimum information exchange process is needed to  
2156 minimize information shared to only the data necessary to address the threats  
2157 the ISAO is intending to cover.
  - 2158 • Consider developing a preventive plan for data protection, including both sys-  
2159 tems and human elements, and an equally clear remedial plan in the event of  
2160 a breach.
  - 2161 • Develop an encryption policy that meets the needs and expectations of em-  
2162 ployees, customers, and counterparts.
  - 2163 • Determine their core membership and audience, and build in security and pri-  
2164 vacy requirements that match the maturity levels commensurate with their  
2165 membership, recognizing that not all entities or participants receiving infor-  
2166 mation have equal capabilities or equal privacy concerns.
  - 2167 • Adopt privacy and security controls that match the capabilities of their mem-  
2168 bers and the criticality of the information shared. This means, for example,  
2169 that sharing threats via email or a phone call to specifically identified recipi-  
2170 ents may have less impact than disseminating information to members  
2171 broadly through a portal. Therefore, depending upon the tools an ISAO is im-  
2172 plementing, the security and privacy requirements will vary.

- 2173
- Establishing clear policy and procedures for data retention and disposition.

2174

## 10 INFORMATION SECURITY

2175 ISAOs will vary in size, sophistication, and abilities. ISAOs will also vary in the  
2176 types of information they share. However, all ISAOs, no matter how established  
2177 or new, face common security challenges. By considering these security issues  
2178 as the ISAO is formed and baking security considerations into an ISAOs busi-  
2179 ness process at the beginning, ISAOs and their members will be more effective  
2180 in building trust among the members, between the members and the ISAO. Fur-  
2181 ther, ensuring security issues are addressed provides assurances to members  
2182 that their information is secure and, therefore, increases the likelihood of them  
2183 sharing information.

2184 Security policies can reflect the various types of information being shared, the dif-  
2185 ferent degree of sensitivity of that information, and how the information is shared.  
2186 For example, a security policy related to sharing automated indicators likely will  
2187 be different from a security policy related to sharing PDF documents. Similarly,  
2188 the policy for storing open-source news might differ from the policy for storing  
2189 sensitive member submissions.

2190 An ISAO's membership may also drive the levels of security needed. ISAOs  
2191 whose members have robust security capabilities themselves will likely have  
2192 more robust security procedures than ISAOs whose members have less ad-  
2193 vanced capabilities. Regardless, however, whether the organization is for-profit  
2194 or non-profit, large or small, security is an important component of an ISAO's  
2195 success.

2196 CISA outlines procedures for private-sector entities to follow when sharing cyber  
2197 threat indicators and defensive measures with the federal government. It also in-  
2198 cludes basic structures and security requirements that companies must meet to  
2199 participate in the process with DHS. It defines strong privacy protections, which  
2200 are also addressed in a companion document. Not all ISAOs will participate in  
2201 the program, for a variety of reasons, but it is important to include reference to  
2202 statutory requirements in this document for ISAOs that choose to participate in  
2203 that program. ISAOs that choose to not participate might still benefit from an un-  
2204 derstanding of the security requirements of that program. DHS and the Depart-  
2205 ment of Justice have issued CISA implementation guidance for the private  
2206 sector.<sup>13</sup>

2207 *(NOTE: The following list of issues is a draft for discussion. It is not intended to*  
2208 *be comprehensive but to provide a foundation throughout the ISAO public com-*  
2209 *menting process. Specific issues—including core privacy issues, the type of in-for-*  
2210 *mation that could be shared, categories of information, and others—would be*  
2211 *handled in companion groups in the Standards Organization process.)*

---

<sup>13</sup> [https://www.us-cert.gov/sites/default/files/ais\\_files/Non-Federal\\_Entity\\_Sharing\\_Guidance\\_%28Sec%20105%28a%29%29.pdf](https://www.us-cert.gov/sites/default/files/ais_files/Non-Federal_Entity_Sharing_Guidance_%28Sec%20105%28a%29%29.pdf).

## 2212 **10.1 CORE SECURITY SUGGESTIONS FOR ISAOs**

### 2213 **10.1.1 BASIC SECURITY COMPONENTS FOR AN ISAO**

#### 2214 **SECURE WEB PORTAL FOR COMMUNICATIONS**

2215 When establishing an ISAO, and at periodic intervals thereafter, ISAO members  
2216 may want to consider and discuss the minimum levels of security they require to  
2217 perform the basic functions expected of their ISAO.

2218 When establishing an ISAO, and at periodic intervals thereafter, ISAOs their  
2219 members may want to discuss and decide on appropriate requirements for secur-  
2220 ing communications. Once the requirements are established, the ISAO can de-  
2221 ploy the appropriate tools to meet those requirements.

2222 When establishing an ISAO, members may want to understand the security lev-  
2223 els and maturity of individual members. This will help ensure that policies are de-  
2224 veloped in a manner that is effective and appropriate for all members. Once an  
2225 ISAO is formed and established, the ISAO may want to conduct a periodic review  
2226 to ensure that its capabilities and policies are appropriate to member capabilities  
2227 and requirements.

2228 DHS has information sharing programs that have defined security requirements  
2229 for how shared information needs to be stored and handled. For example, the Cyber  
2230 Information Sharing and Collaboration Program states specific requirements for  
2231 how an organization must store information as part of that program. If ISAOs in-  
2232 tend to participate in such programs, they should ensure that they establish secu-  
2233 rity policies that meet these requirements.

#### 2234 **PUBLIC KEY INFRASTRUCTURE (PKI) AND “SECURITY BY DESIGN”**

2235 Before building or buying a platform for information sharing, it is first worth under-  
2236 standing the basic security requirements that will be needed to facilitate infor-  
2237 mation sharing among members. It is much easier and less expensive to build  
2238 the security requirements into the system up front, than it is to add them on later.

2239 This includes considering whether encryption is required and, if so, what level of  
2240 encryption is appropriate.

2241 As an example, policies could detail whether all members will use certificates for  
2242 signing and authenticating emails in a PKI exchange mechanism, whether the  
2243 ISAO will deploy two-factor authentication, and whether documents being shared  
2244 would be encrypted separately from the PKI process.

#### 2245 **ACCESS CONTROLS**

2246 Generally, a key component of security is access controls, which govern the fact  
2247 that not everyone in an organization needs access to all of its documents. There-  
2248 fore, it is appropriate that controls are in place so that people can only access  
2249 documents they are authorized to access. It also is appropriate that the ISAOs

2250 and their members discuss and decide on appropriate access controls for individ-  
2251 uals within member entities and ISAO staff.

2252 Another component of access control is to revoke credentials for people if they  
2253 change jobs within an organization or leave an organization completely. Thus it is  
2254 appropriate for ISAOs and its members to agree on a common policy on how to  
2255 ensure that credentials are revoked when a member or employee is no longer  
2256 permitted access to information.

2257 Another general security principle is that data should be federated based upon  
2258 their criticality, and access controls may vary for different types of data. For ex-  
2259 ample, it might be appropriate to allow the head of marketing access to an organ-  
2260 ization's collection of open source news reports, but that person may not need  
2261 access to sensitive indicators shared by members or partners.

## 2262 **CYBERSECURITY ATTACK AND DATA BREACH NOTIFICATION**

2263 To maintain a level of trust and dependability between and among members,  
2264 ISAOs may want to consider establishing internal reporting plans and communi-  
2265 cation lines with companies in the event that they are a victim of a cybersecurity  
2266 attack that impacts the ISAO and its members. It should be noted that ISAOs are  
2267 subject to state and local data breach notification laws should the ISAOs be vic-  
2268 tims of a cyberattack that impacts PII an ISAO holds for ISAO employees, con-  
2269 tractors, members, or partners.

## 2270 **10.1.2 DATA CLASSIFICATION, DISTRIBUTION, AND LABELING**

2271 Another general security principle is to appropriately mark and label information.  
2272 This could include noting specific handling instructions for a particular document  
2273 or marking it with a general classification. Such marking helps consumers under-  
2274 stand how the information can be used and stored. ISAOs and their members  
2275 can develop a classification scheme that fits their individual security policies. Fur-  
2276 ther, generally a common practice is to enable the entity that owns the document  
2277 to control how that information is shared. This concept is commonly known as  
2278 "originator control." The following are some examples of potential components to  
2279 consider in a security policy:

- 2280 • Using the Traffic Light Protocol (TLP) Red/Amber/Green or other classifica-  
2281 tion schemes, which can help members understand how to share information  
2282 according to data classification standards.
- 2283 • Policies that detail how members can use indicators that are shared. For ex-  
2284 ample, can they use those indicators to protect their customers or to only pro-  
2285 tect their specific network?
- 2286 • Internal structures and policies that limit the risk of members sharing non se-  
2287 curity proprietary information.

- 2288
- 2289
- 2290
- Determining whether the ISAO should establish multiple sharing groups or forums based that reflect the ability of its members to receive or store various levels of sensitive information.
- 2291
- 2292
- Issues for anonymizing member submissions, as well as establishing parameters for sharing when they want to use anonymization.
- 2293
- 2294
- 2295
- Clear data retention and disposition policy and procedures.  
(NOTE: The current DHS AIS program has established data retention policies that are more specific.)
- 2296
- 2297
- Options for sharing information that may include automated intake and dissemination, email, and other methods.
- 2298
- Policies that deal with verbal submissions by members.
- 2299
- 2300
- As an example, it would be helpful to consider distribution policies to set up rules for sharing data via email. Policies could cover matters such as:
- 2301
- When to utilize the blind copy email feature.
- 2302
- What information should be sent via encrypted email.
- 2303
- 2304
- Criteria for who has access to mailing lists and who can be on the mainlining list.
- 2305
- When to use “reply all” structures.

### 2306 **10.1.3 ISAO MEMBER SECURITY**

2307 While security of the ISAO itself is important, trust is enhanced when members  
2308 understand how other members will handle and store information that is being  
2309 shared through and within the ISAO. Therefore, when creating and ISAO, mem-  
2310 bers may want to consider and develop policies related to the security responsi-  
2311 bilities of members companies. Some potential considerations include:

- 2312
- 2313
- 2314
- Detailing, in a common member agreement or other document common to all members, what the responsibilities are of each member in securing information shared through the ISAO.
- 2315
- 2316
- Detailing what tools will be used for sharing information and the policies for granting members access to those tools.
- 2317
- 2318
- Establishing methods to communicate and/or train members on what their responsibilities are under the ISAO security policy.

2319 It is important to note that these ISAO security policies are not a replacement for  
2320 appropriate enterprise-wide cybersecurity practices of an ISAO member com-  
2321 pany. They also are not a replacement for any regulatory requirements or obliga-  
2322 tions ISAO member companies might be required to follow. ISAO members  
2323 should take all appropriate steps to secure their enterprises. There are a myriad  
2324 of guides to help ISAO members manage cyber risk, including the NIST Cyberse-

2325 security Framework. Instead, the point of an ISAO security policy is to detail mem-  
2326 ber responsibilities specific to securing information they receive from or share  
2327 with the ISAO.

#### 2328 **10.1.4 GLOBAL SECURITY ISSUES**

2329 If ISAOs include global corporations, it is important for the ISAO to be aware of  
2330 and discuss other existing requirements for companies involving information se-  
2331 curity, cybersecurity, privacy, and overall information sharing.

- 2332 • If there are cross-border data transfers for information sharing, ISAOs should  
2333 become familiar with any governing international requirements. For example,  
2334 the United States is in the process of working with the EU on Privacy Shield,  
2335 which includes information security, privacy, and other requirements. Other  
2336 EU requirements that are important to be aware of include the EU GDPR and  
2337 the EU Network and Information Security Directive.
- 2338 • ISAOs should be aware of and integrate other regulatory requirements as  
2339 needed for other countries around the world. In some instances these require-  
2340 ments extend to vendors and third parties, so ISAOs will need to be aware of  
2341 and comply with these requirements.

### 2342 **11 ISAO STANDARDS ORGANIZATION SUPPORT**

#### 2343 **11.1 ASSISTING EMERGING ISAOs**

2344 The purpose of the Standards Organization's support function is to assist emerg-  
2345 ing ISAOs as they implement and adopt processes that enhance their value to-  
2346 ward and their coordination with one another.

2347 Organizations have been seeking information and assistance for defining the  
2348 value of and becoming ISAOs long before the ISAO SO was formed. The ISAO  
2349 SO is assuming a broad responsibility for processes that began long before its  
2350 existence, and that will not wait for it to develop and mature.

2351 ISAO support can look at emerging organizations and existing ISAOs to identify  
2352 processes and capabilities that are required to identify and establish meaningful  
2353 relationships of support between them and the ISAO SO, and to help the ISAO  
2354 SO translate their support requirements into efficient and sustainable organiza-  
2355 tional processes that the ISAO SO can review and adopt to meet the needs of its  
2356 larger and growing constituency.

2357 The following discussion outlines five key processes that ISAO support has iden-  
2358 tified and is researching and developing to support ISAO SO intake and sus-  
2359 tained engagement with organizations and ISAOs relevant to its support mission.  
2360 These process areas include intake, ISAO checklists, alignment, mentorship, and  
2361 feedback. The deliverables and outcomes of ISAO support will provide an invest-  
2362 ment in the infrastructure that will hopefully support potential, emerging, or devel-  
2363 oping ISAOs for many years to come.

## 11.2 SUPPORT FUNCTIONS

2364  
2365  
2366  
2367  
2368  
  
2369  
  
2370  
2371  
  
2372  
2373  
2374  
  
2375  
2376  
2377  
2378  
  
2379  
2380  
2381  
2382  
2383  
2384  
  
2385  
2386  
2387  
2388  
2389  
2390

ISAO support seeks to define and enhance the flow of the ISAO SO's post-out-reach support efforts to organizations seeking its assistance. In doing so, support is initially focused on five basic functions associated with ISAO SO coordination: intake, ISAO checklists, alignment, mentorship, and feedback.

These functions are briefly defined as follows:

- **Intake**—The workflows and processes for the ISAO SO connecting with organizations seeking information about or assistance in forming an ISAO.
- **ISAO checklists**—The content and processes for identifying the data necessary to inform ISAO SO products, services, relevant standards, and relationships of value to a particular organization or ISAO in its intake process.
- **Alignment**—The activities and functions by which the ISAO SO and/or the organization seeking ISAO SO assistance may identify and connect with products, services, relevant standards, and relationships of value to their organizational development and maturity.
- **Mentorship**—The ISAO SO capability that allows organizations seeking ISAO SO assistance to identify, connect with, obtain support from, and to evaluate the effectiveness of organizations that have identified themselves as mentors for particular aspects of organizational development and maturity, and that have offered to make themselves available to support or assist the development of other organizations.
- **Feedback**—The content and processes for soliciting, capturing, and leveraging organizational input on ISAO SO products, services, relevant standards, and relationships as provided by organizations seeking ISAO SO assistance in order to assess their value to the ISAO user community and to enable organizations to continually refine them.

2391 **12 APPENDIX A REFERENCES**

2392 [Placeholder—reserved for primary reference sources]

2393

2394 **13 APPENDIX B GLOSSARY**

2395 Selected terms used in the publication are defined below.

2396 **Alert:** Timely information about current security issues, vulnerabilities, and exploits.  
2397 [Source: US-CERT]

2398 **Analysis:** A detailed examination of the elements or structure of cybersecurity infor-  
2399 mation, in order to identify the applicability to increasing the security of an information  
2400 system in some way.

2401 **Automated Cybersecurity Information Sharing:** The exchange of data-related risks  
2402 and practices relevant to increasing the security of an information system utilizing pri-  
2403 marily machine programmed methods for receipt, analysis, dissemination, and integra-  
2404 tion.

2405 **Campaigns:** In the context of cybersecurity, a campaign or attack via cyberspace that  
2406 targets an enterprise's use of cyberspace for the purpose of disrupting, disabling, de-  
2407 stroying, or maliciously controlling a computing environment/infrastructure, destroying  
2408 the integrity of the data, or stealing controlled information. [Source: NIST Glossary of  
2409 Key Information Security Terms, NISTIR 7298 Revision 2]

2410 **Computer Security Incident:** See "Incident."

2411 **Computer Security Incident Response Team (CSIRT):** A capability set up for the pur-  
2412 pose of assisting in responding to computer security-related incidents; also called a  
2413 Computer Incident Response Team (CIRT) or a CIRC (Computer Incident Response  
2414 Center, Computer Incident Response Capability).

2415 **Cyber Threat Information:** Information (such as indications, tactics, techniques, proce-  
2416 dures, behaviors, motives, adversaries, targets, vulnerabilities, courses of action, or  
2417 warnings) regarding an adversary, its intentions, or actions against information technol-  
2418 ogy or operational technology systems.

2419 **Cybersecurity Information:** Data-related risks and practices relevant to increasing the  
2420 security of an information system.

2421 **Cybersecurity Information Sharing:** The exchange of data-related risks and practices  
2422 relevant to increasing the security of an information system.

2423 **Cybersecurity Purpose:** The purpose of protecting an information system or infor-  
2424 mation that is stored on, processed by, or transiting an information system from a cyber-  
2425 security threat or security vulnerability.

2426 **Cybersecurity Threat:** An action on or through an information system that may result in  
2427 an unauthorized effort to adversely impact the security, availability, confidentiality, or in-

2428 integrity of an information system or information that is stored on, processed by, or transit-  
2429 ing an information system. The term does not include any action that solely involves a  
2430 violation of a consumer term of service or a consumer licensing agreement.

2431 **Cyber Threat Indicator:** Information that is necessary to describe or identify—

- 2432 • malicious reconnaissance, including anomalous patterns of communications  
2433 that appear to be transmitted for the purpose of gathering technical infor-  
2434 mation related to a cybersecurity threat or security vulnerability;
- 2435 • a method of defeating a security control or exploitation of a security vulnera-  
2436 bility;
- 2437 • a security vulnerability, including anomalous activity that appears to indicate  
2438 the existence of a security vulnerability;
- 2439 • a method of causing a user with legitimate access to an information system or  
2440 information that is stored on, processed by, or transiting an information sys-  
2441 tem to unwittingly enable the defeat of a security control or exploitation of a  
2442 security vulnerability;
- 2443 • malicious cyber command and control;
- 2444 • the actual or potential harm caused by an incident, including a description of  
2445 the information exfiltrated as a result of a particular cybersecurity threat; or
- 2446 • any combination thereof.

2447 **Defensive Measure:** An action, device, procedure, signature, technique, or other meas-  
2448 ure applied to an information system or information that is stored on, processed by, or  
2449 transiting an information system that detects, prevents, or mitigates a known or sus-  
2450 pected cybersecurity threat or security vulnerability.

2451 **Enriched Cybersecurity Information:** Cybersecurity information that is combined with  
2452 multiple different data sets/streams to produce a more comprehensive set of data.

2453 **Enhanced Cybersecurity Information:** Cybersecurity information that is analyzed to  
2454 identify trends, insights, or other understanding.

2455 **Event:** Any observable occurrence in a network or system.

2456 **False Negative:** An instance in which a security tool intended to detect a particular  
2457 threat fails to do so.

2458 **False Positive:** An instance in which a security tool incorrectly classifies benign content  
2459 as malicious.

2460 **Incident:** A violation or imminent threat of violation of computer security policies, ac-  
2461 ceptable use policies, or standard security practices.

- 2462 **Incident Handling:** The mitigation of violations of security policies and recommended  
2463 practices.
- 2464 **Incident Report:** A written summary of an incident that describes the steps in the inves-  
2465 tigation of the event, the findings, and the resolution.
- 2466 **Incident Response:** See “Incident Handling.”
- 2467 **Indicator:** An artifact or observable evidence that suggests that an adversary is prepar-  
2468 ing to attack, that an attack is currently underway, or that a compromise may have al-  
2469 ready occurred.
- 2470 **Information Life Cycle:** The stages through which information passes, typically charac-  
2471 terized as creation or collection, processing, dissemination, use, storage, and disposi-  
2472 tion. [Source: Office of Management and Budget, Circular A-130]
- 2473 **Malware:** A program that is covertly inserted into another program with the intent to de-  
2474 stroy data, run destructive or intrusive programs, or otherwise compromise the confiden-  
2475 tiality, integrity, or availability of the victim’s data, applications, or operating system.  
2476 [Source: NIST SP 800-83, Revision 1]
- 2477 **Malicious Cyber Command and Control:** A method for unauthorized remote identifi-  
2478 cation of, access to, or use of an information system or information that is stored on,  
2479 processed by, or transiting an information system.
- 2480 **Malicious Reconnaissance:** A method for actively probing or passively monitoring an  
2481 information system for the purpose of discerning its security vulnerabilities, if such  
2482 method is associated with a known or suspected cybersecurity threat.
- 2483 **Monitor:** To acquire, identify, scan, or possess information that is stored on, processed  
2484 by, or transiting an information system.
- 2485 **Operational Analysis:** Examination of any combination of threats, vulnerabilities, inci-  
2486 dents, or practices that results in methods to protect specific data, infrastructure, or  
2487 functions (for example, incident analysis, identification of specific tactics, techniques,  
2488 procedures, or threat actors, etc.)
- 2489 **Precursor:** A sign that an attacker may be preparing to cause an incident.
- 2490 **Profiling:** Measuring the characteristics of expected activity so that changes to it can be  
2491 more easily identified.
- 2492

**2493 Privacy Framework Catalog:****2494 NIST Special Publication 800-53, Revision 4**

2495 Appendix J, *Privacy Control Catalog*, is a new addition to NIST Special Publica-  
2496 tion 800-53. It addresses the privacy needs of federal agencies. The Privacy Ap-  
2497 pendix outlines a structured set of privacy controls, based on best practices, that  
2498 comply with applicable federal laws, Executive Orders, directives, instructions,  
2499 regulations, policies, standards, and guidance. Additionally, it establishes a link-  
2500 age and relationship between privacy and security controls for purposes of en-  
2501 forcing privacy and security requirements that may overlap in concept and in  
2502 implementation within federal information systems, programs, and organizations.

**2503 HITRUST CSF (Healthcare)**

2504 The Health Information Trust Alliance, or HITRUST, formed in 2014 to integrate  
2505 privacy requirements into the healthcare industry’s Common Security Framework  
2506 (CSF) security control standard, initially to support the SECURETexas covered  
2507 entity privacy and security certification program, but with the intent to support the  
2508 healthcare privacy community more broadly. Primarily based on the language in  
2509 the HIPAA Privacy Act, the Working Group also integrated the privacy require-  
2510 ments specified in NIST SP 800-53 r4 Appendix J to support both civilian and  
2511 federal government healthcare entities. HITRUST is also working with the Texas  
2512 Health Services Authority and the Texas Medical Association to create a simpli-  
2513 fied information privacy and security program for smaller organizations, such as  
2514 physician practices, that would adequately address HIPAA’s standards and im-  
2515 plementation specifications while providing the flexibility necessary for successful  
2516 implementation and broad adoption across the industry.

**2517 American Institute of CPAs (AICPA)**

2518 The AICPA and the Canadian Institute of Chartered Accountants (CICA) have  
2519 formed the AICPA/CICA Privacy Task Force, which has developed Generally Ac-  
2520 cepted Privacy Principles (GAPP). This document supersedes the AICPA and  
2521 CICA Privacy Framework. Using GAPP, CPAs can help organizations design and  
2522 implement sound privacy practices and policies. These principles and criteria  
2523 were developed and updated by volunteers who considered both current interna-  
2524 tional privacy regulatory requirements and best practices. These principles and  
2525 criteria were issued following the due process procedures of both institutes,  
2526 which included exposure for public comment. The adoption of these principles  
2527 and criteria is voluntary.

2528 **Real-time information sharing:** See “Automated Cybersecurity Information Sharing.”

2529 **Secure Portal:** A web-enabled resource that provides controlled secure access to and  
2530 interactions with relevant information assets (information content, applications, and  
2531 business processes) to selected audiences using web-based technologies in a person-  
2532 alized manner.

2533 **Security Control:** The management, operational, and technical controls used to protect  
2534 against an unauthorized effort to adversely affect the confidentiality, integrity, and avail-  
2535 ability of an information system or its information.

2536 **Security Vulnerability:** Any attribute of hardware, software, process, or procedure that  
2537 could enable or facilitate the defeat of a security control.

2538 **Signature:** A recognizable, distinguishing pattern associated with an attack, such as a  
2539 binary string in a virus or a particular set of keystrokes used to gain unauthorized ac-  
2540 cess to a system.

2541 **Situational Awareness:** Comprehension of information about the current and develop-  
2542 ing security posture and risks, based on information gathered, observation, analysis,  
2543 and knowledge or experience.

2544 **Social Engineering:** An attempt to trick someone into revealing information (such as a  
2545 password) that can be used to attack systems or networks.

2546 **Threat:** Any circumstance or event with the potential to adversely impact organizational  
2547 operations (including mission, functions, image, or reputation), organizational assets, in-  
2548 dividuals, other organizations, or the nation through an information system via unauthor-  
2549 ized access, destruction, disclosure, or modification of information, and/or denial of  
2550 service. [Source: NIST SP 800-30, Revision 1]

2551 **Threat Actor:** An individual or group involved in malicious cyber activity. [Source:  
2552 MITRE, STIX]

2553 **Threat Source:** The intent and method targeted at the intentional exploitation of a vul-  
2554 nerability or a situation and method that may accidentally exploit a vulnerability.  
2555 [Source: NIST SP 800-30, Revision 1 and CNSSI No. 4009]

2556 **Trend Analysis:** Examination of data to identify any combination of broad, non-obvious,  
2557 or emerging actions (for example, threat actor campaigns and intent, common vulnera-  
2558 bilities and configurations exploited, merging operational analytics with non-like data  
2559 streams such as assessments, etc.).

2560 **Vulnerability:** A weakness in an information system, system security procedures, inter-  
2561 nal controls, or implementation that could be exploited by a threat source. [Source:  
2562 NIST SP 800-30, Revision 1]

**2564 14 APPENDIX C ACRONYMS**

2565

2566	AIS	Automated Indicator Sharing
2567	CERT	Computer Emergency Response Team
2568	CISA	Cybersecurity Information Sharing Act
2569	CONOPS	Concept of Operations
2570	CTI	Cyber (Common) Threat Indicator
2571	DHS	Department of Homeland Security
2572	EO	Executive Order
2573	EU	European Union
2574	GDPR	General Data Protection Regulation (Directive 95/46/EC)
2575	HIPAA	Health Information Privacy and Portability Act
2576	HITECH	Health Information Technology for Economic and Clinical Health Act
2577	IP	Internet Protocol
2578	ISAC	Information Sharing and Analysis Center
2579	ISAO	Information Sharing and Analysis Organization
2580	IT	Information Technology
2581	LLC	Limited Liability Company
2582	NCCIC	National Cybersecurity & Communications Integration Center
2583	NIST	National Institute of Standards and Technology
2584	PII	Personable Identifiable Information
2585	SO	Standards Organization
2586	STIX	Structured Threat Information eXpression
2587	TAXII	Trusted Automated eXchange of Indicator Information
2588	TLP	Traffic Light Protocol
2589	TTP	Tactics, Techniques & Procedures
